

Watson Studio SPSS Modeler Overview

This lab will introduce the SPSS Modeler capability using the Titanic dataset. The lab will guide the development of an SPSS Modeler stream that will prepare the input data for modeling to run a machine learning algorithm predicting survivability of a passenger on the Titanic.

Step 1: Adding a Data Asset to the Titanic project

1. Download the Titanic data file by clicking on the link [Titanic Data Set](#) and following the instructions below.

Right click on Raw, and click on Save link as

The screenshot shows a GitHub repository page for 'jpatter / ML-POT'. The repository has 1 issue, 1 pull request, 1 project, and 1 contributor. The 'titanic_cleaned.csv' file is displayed in a table format. The table has two header rows: one for columns and one for data. The data rows show passenger information with columns: pclass, survived, name, sex, sibsp, parch, ticket, fare, and embarked. A yellow arrow points to the 'Raw' button in the top right corner of the file preview area.

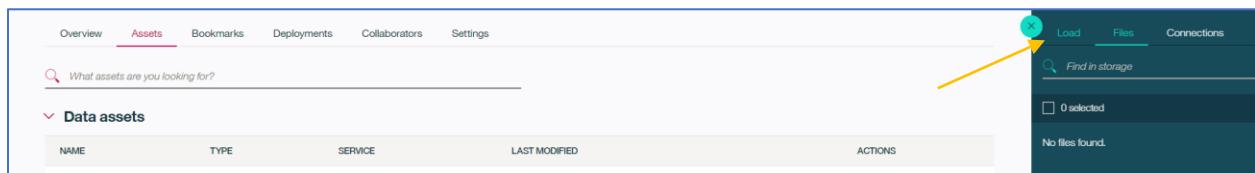

1	pclass	survived	name	sex	sibsp	parch	ticket	fare	embarked
2	1	1	Allen, Miss. Elisabeth Walton	female	0	0	24160	211.337500	S
3	1	1	Allison, Master. Hudson Trevor	male	1	2	113781	151.550000	S
4	1	0	Allison, Miss. Helen Loraine	female	1	2	113781	151.550000	S
5	1	0	Allison, Mr. Hudson Joshua Creighton	male	1	2	113781	151.550000	S
6	1	0	Allison, Mrs. Hudson JC (Babe) Molina Daniels	female	1	2	113781	151.550000	C

2. Go back to the Watson Studio project. Click on **New data asset**, or if you don't see **New data asset**, click on the  icon.

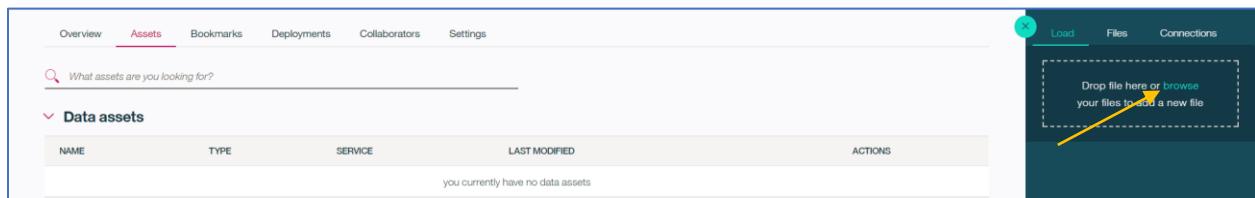

A screenshot of the Watson Studio interface. At the top right, there is a button labeled "New data asset" with a plus sign icon. A yellow arrow points from the bottom right towards this button. Below the button is a table header for "Data assets" with columns: NAME, TYPE, SERVICE, LAST MODIFIED, and ACTIONS. The table body below the header shows the message "you currently have no data assets".

3. Click on the **Load** tab.

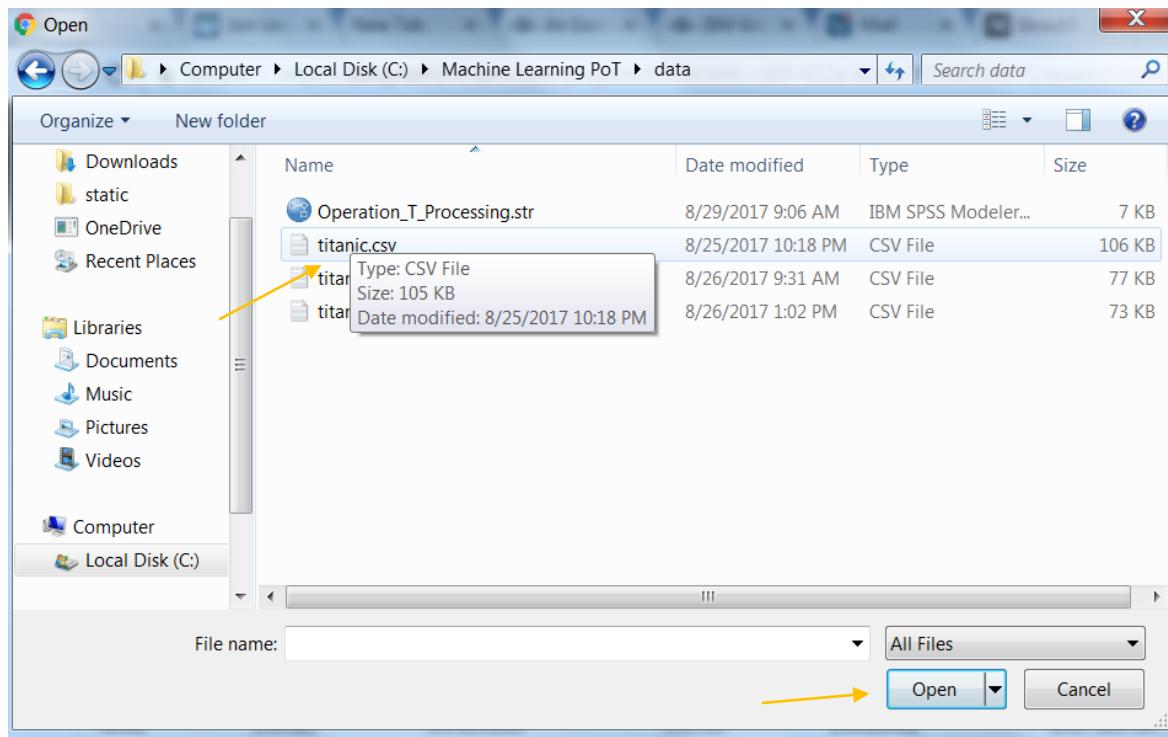

A screenshot of the Watson Studio Assets page. The "Assets" tab is selected at the top. On the right side, there is a sidebar with tabs: Load, Files, and Connections. The "Load" tab is selected and has a green circular icon with a white "x" above it. A yellow arrow points from the bottom right towards this icon. Below the sidebar, there is a search bar with the placeholder "What assets are you looking for?", a section titled "Data assets" with a table header, and a message "No files found."

4. Click on **browse**.

A screenshot of the Watson Studio Assets page. The "Assets" tab is selected at the top. On the right side, there is a sidebar with tabs: Load, Files, and Connections. The "Load" tab is selected and has a green circular icon with a white "x" above it. A yellow arrow points from the bottom right towards this icon. Below the sidebar, there is a search bar with the placeholder "What assets are you looking for?", a section titled "Data assets" with a table header, and a message "Drop file here or browse your files to add a new file".

5. Go to the folder where the titanic_csv file is stored. Select the titanic.csv file and then click **Open**.

6. The file is now added as a Data Asset.

A screenshot of a software interface showing the 'Data assets' section. The title bar says 'Data assets'. Below it, a message says '0 assets selected.' There is a table with columns: NAME, TYPE, SERVICE, CREATED BY, LAST MODIFIED, and ACTIONS. One row is visible, representing the 'titanic.csv' file. The 'Actions' column has a three-dot menu icon. At the top right of the table area, there is a '+ New data asset' button.

NAME	TYPE	SERVICE	CREATED BY	LAST MODIFIED	ACTIONS
titanic.csv	Data Asset	Project	Michael	7 Feb 2018, 5:01:18 pm	⋮

Step 2: Create a Model to predict survival

In this section, we will create a Machine Learning flow using SPSS nodes. Documentation describing the nodes is available at <https://dataplatform.ibm.com/docs/content/analyze-data/ml-canvas-spss.html?context=analytics>.

Step 2.1 Create a New Flow and Load the Data

1. In the Watson Studio project, click on **New flow** in the SPSS Modeler flows section.

The screenshot shows the 'SPSS Modeler flows' section in a Watson Studio project. It displays a table with columns: NAME, CREATED BY, LAST MODIFIED, and ACTIONS. A message at the bottom states 'you currently have no spss modeler flows'. In the top right corner, there is a button labeled 'New flow' with a plus sign icon, which has a yellow arrow pointing to it.

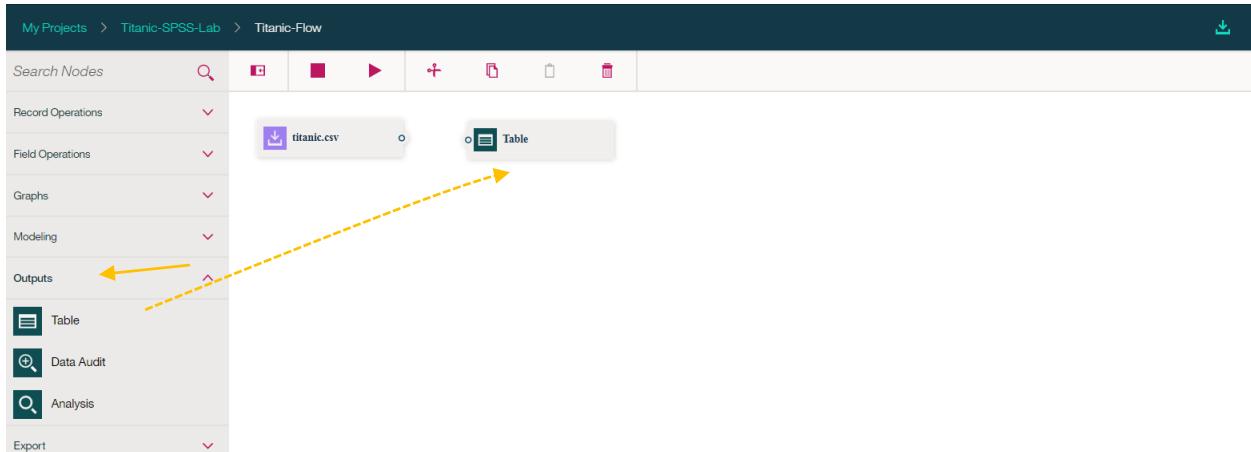

2. Enter a **Name** for the flow, optionally enter a **Description**, select IBM SPSS Modeler for the **Runtime**, and click on **Create**.

The screenshot shows the 'SPSS Modeler' creation dialog. At the top, there are tabs: 'New' (selected), 'From file', and 'From example'. Below the tabs, the 'Name*' field contains 'Titanic-Flow' with a yellow arrow pointing to it. The 'Description' area has a placeholder 'Type description here.' with a yellow arrow pointing to it. The 'Runtime' dropdown menu is open, showing 'IBM SPSS Modeler' with a yellow arrow pointing to it. At the bottom, there are 'Cancel' and 'Create' buttons, with a yellow arrow pointing to the 'Create' button.

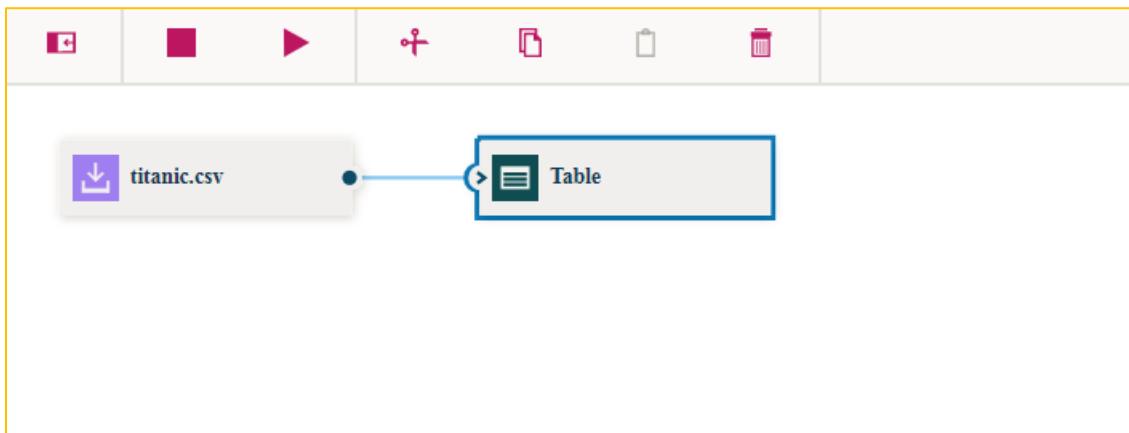

3. This opens the Flow Editor. Click on the titanic.csv file and hold the left mouse key and **drag the file onto the left side of the canvas**. Release the left mouse key.

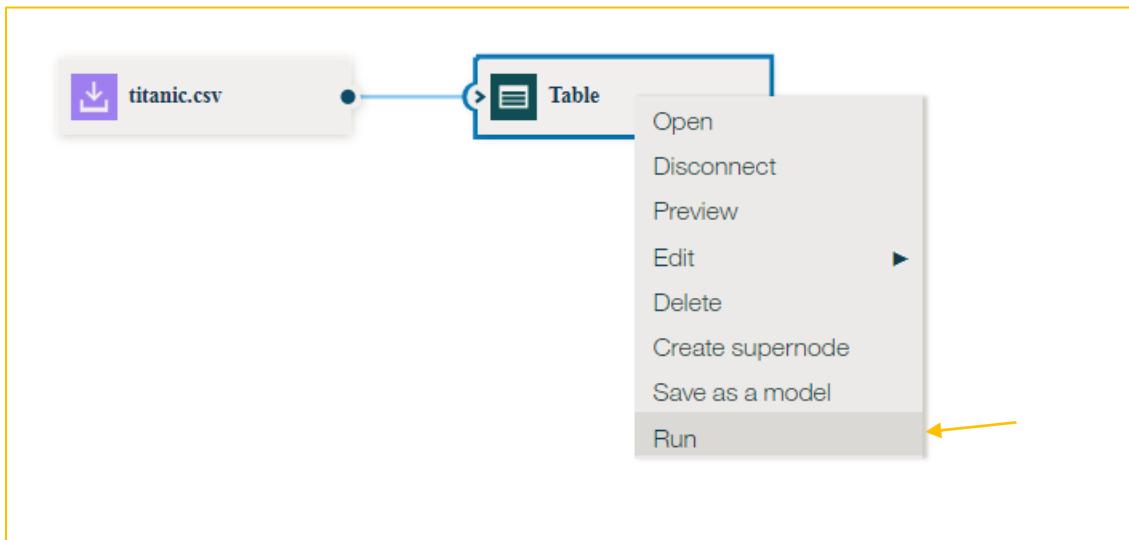

4. Click on the **Outputs** menu item in the Node Palette on the left and then click on the **Table** icon and drag the icon to the right of the titanic.csv icon. The SPSS Table node will display the contents of the csv file. If the Node Palette is not visible, click on the Node Palette icon 

5. Connect the right side of the titanic.csv icon to the left side of the Table icon. This is accomplished by clicking on the little circle at the right side of the titanic.csv icon holding the left mouse key and dragging the mouse to the little circle on the left side of the Table icon, and then releasing the left mouse key.

6. Right click on the **Table** icon, and select **Run**.

7. The “Running Flow” prompt will appear and then when completed a Table output selection will appear on the right side of the screen under the **Outputs** tab. If the Table output selection does not appear, select the  icon.

The screenshot shows the 'Outputs' tab selected in a software interface. Below it, the 'Versions' tab is visible. A table selection is shown with the text 'Table (14 fields, 1,309 records)' and a small icon of three horizontal bars.

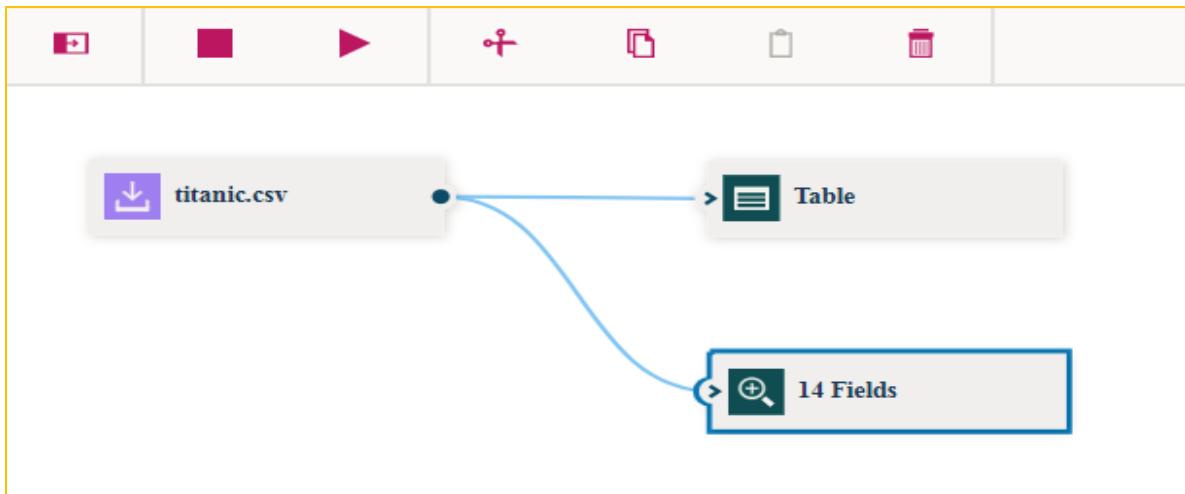

8. Double click on the Table selection above and the contents of the titanic.csv will be displayed. Each row contains information on a passenger on the Titanic. We will use this data to make predictions on survivability.

PCCLASS	SURVIVED	NAME	SEX	AGE	SIBSP	PARCH	TICKET	FARE	CABIN	EMBARKED	BOAT
1	1	Allen, Miss. Elisabeth	female	29	0	0	24160	211.3375	B5	S	2
1	1	Allison, Master. Hudson	male	0.9167	1	2	113781	151.55	C22 C26	S	11
1	0	Allison, Miss. Helen L.	female	2	1	2	113781	151.55	C22 C26	S	
1	0	Allison, Mr. Hudson J.	male	30	1	2	113781	151.55	C22 C26	S	
1	0	Allison, Mrs. Hudson	female	25	1	2	113781	151.55	C22 C26	S	
1	1	Anderson, Mr. Harry	male	48	0	0	19952	26.55	E12	S	3
1	1	Andrews, Miss. Korn	female	63	1	0	13502	77.9583	D7	S	10

1	1	Aubart, Mme. Leontine	female	24	0	0	PC 17477	69.3	B35	C	9
1	1	Barber, Miss. Ellen "Belle"	female	26	0	0	19677	78.65		S	6
1	1	Barkworth, Mr. Alger	male	80	0	0	27042	30	A23	S	B

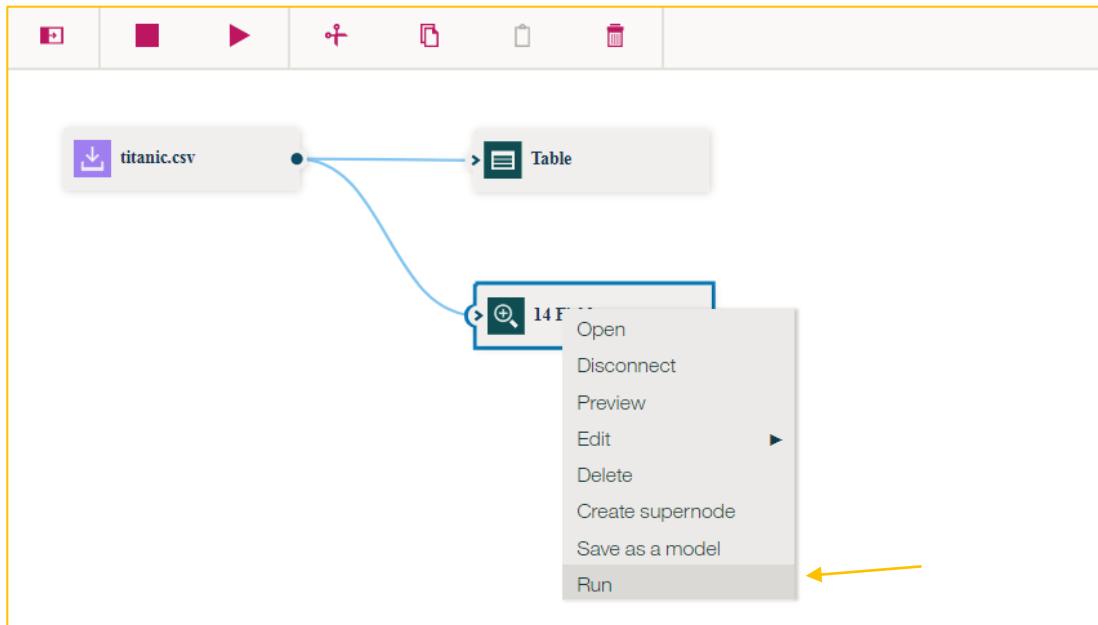

Step 2.2 Explore the Data using the Data Audit Node

Perusing through the data in the table, we can see that there are missing values. The SPSS Modeler has a Data Audit node that provides profiling information on the input data that is useful for cleansing the data. It provides a comprehensive first look at the data, including summary statistics, as well as information about outliers, missing values, and extremes.

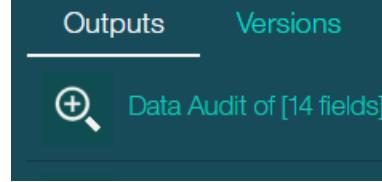

1. Add a **Data Audit** node to the flow clicking on the **Outputs** menu item in the Node Palette, and then dragging the **Data Audit** node to underneath the titanic.csv node. If the Node Palette is not visible, click on the Node Palette icon . Connect the titanic.csv node to the Data Audit node. The canvas should appear as below.

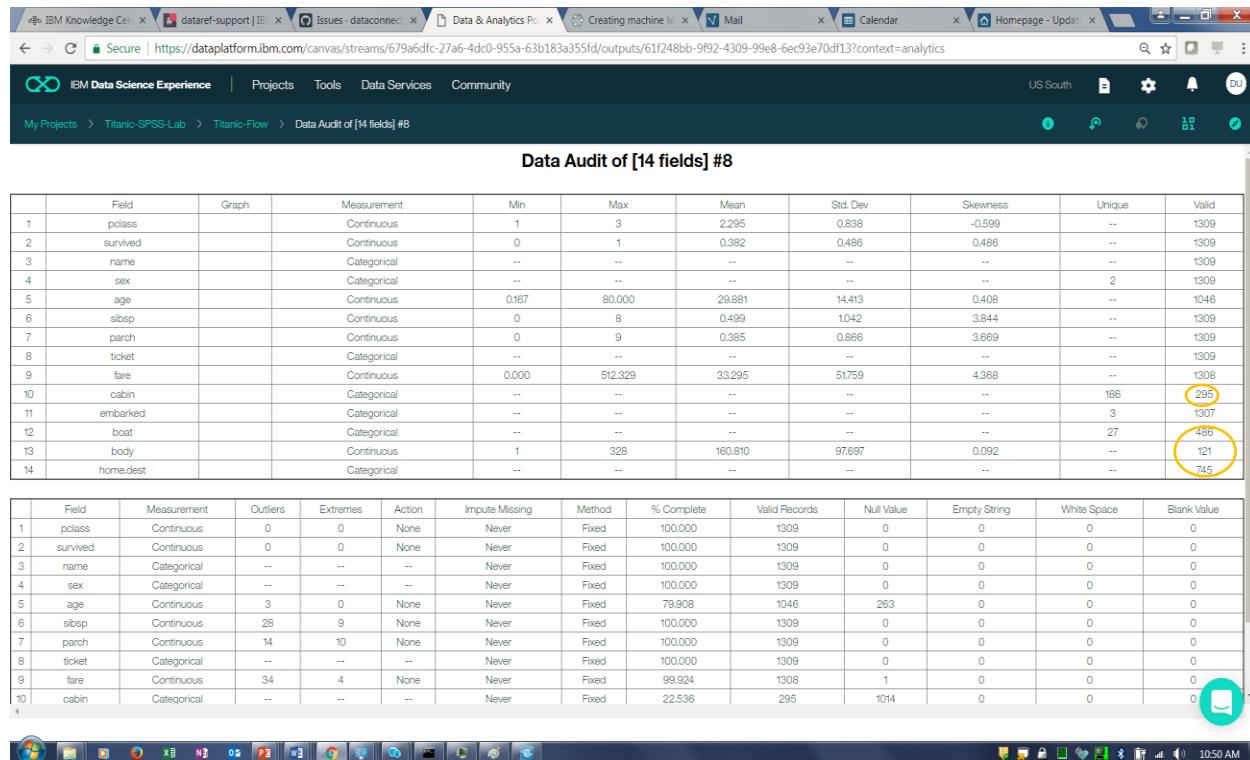

2. Right click on the **Data Audit** node and click **Run**.

3. The “Running Flow” prompt will appear and then when completed a Data Audit output selection will appear on the right side of the screen under the **Outputs** tab. If the **Outputs** tab doesn’t display, click on the  icon.

4. Double click on the **Data Audit of [14 fields]** to view the Data Audit output. We can see that several fields have many missing values (cabin, boat, body, home.dest). These fields will be removed using a **Filter** node below. Other fields have only a few missing values (fare, embarked, age). The rows containing the missing values will be removed using a **Select** node below.

	Field	Graph	Measurement	Min	Max	Mean	Std. Dev	Skewness	Unique	Valid
1	pclass		Continuous	1	3	2.295	0.838	-0.599	--	1309
2	survived		Continuous	0	1	0.982	0.486	0.486	--	1309
3	name		Categorical	--	--	--	--	--	--	1309
4	sex		Categorical	--	--	--	--	--	2	1309
5	age		Continuous	0.167	80.000	29.881	14.413	0.408	--	1046
6	sibsp		Continuous	0	8	0.499	1.042	3.844	--	1309
7	parch		Continuous	0	9	0.985	0.986	3.669	--	1309
8	ticket		Categorical	--	--	--	--	--	--	1309
9	fare		Continuous	0.000	512.329	33.295	51.759	4.368	--	1308
10	cabin		Categorical	--	--	--	--	--	186	295
11	embarked		Categorical	--	--	--	--	--	3	1307
12	boat		Categorical	--	--	--	--	--	27	486
13	body		Continuous	1	328	160.810	97.697	0.092	--	121
14	home.dest		Categorical	--	--	--	--	--	--	745

	Field	Measurement	Outliers	Extremes	Action	Impute Missing	Method	% Complete	Valid Records	Null Value	Empty String	White Space	Blank Value
1	pclass	Continuous	0	0	None	Never	Fixed	100.000	1309	0	0	0	0
2	survived	Continuous	0	0	None	Never	Fixed	100.000	1309	0	0	0	0
3	name	Categorical	--	--	--	Never	Fixed	100.000	1309	0	0	0	0
4	sex	Categorical	--	--	--	Never	Fixed	100.000	1309	0	0	0	0
5	age	Continuous	3	0	None	Never	Fixed	79.908	1046	263	0	0	0
6	sibsp	Continuous	28	9	None	Never	Fixed	100.000	1309	0	0	0	0
7	parch	Continuous	14	10	None	Never	Fixed	100.000	1309	0	0	0	0
8	ticket	Categorical	--	--	--	Never	Fixed	100.000	1309	0	0	0	0
9	fare	Continuous	34	4	None	Never	Fixed	99.924	1308	1	0	0	0
10	cabin	Categorical	--	--	--	Never	Fixed	22.536	295	1014	0	0	0

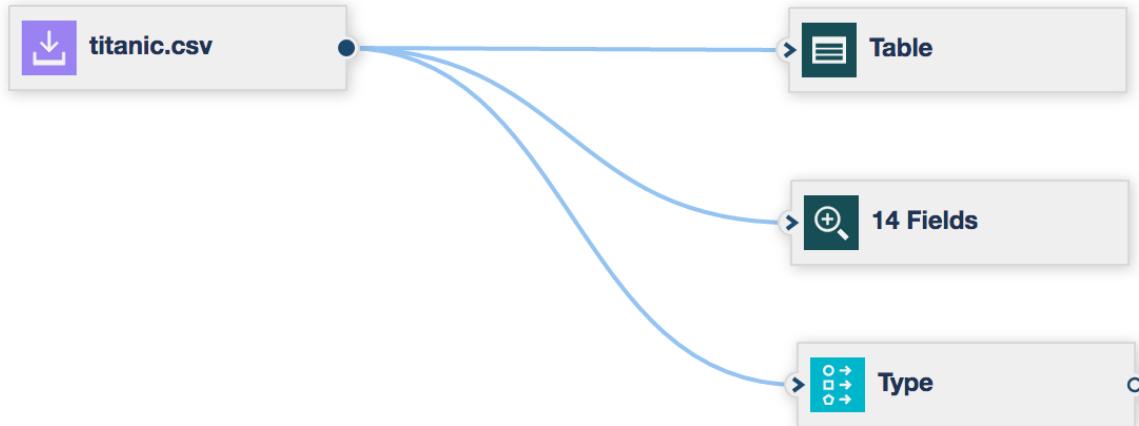

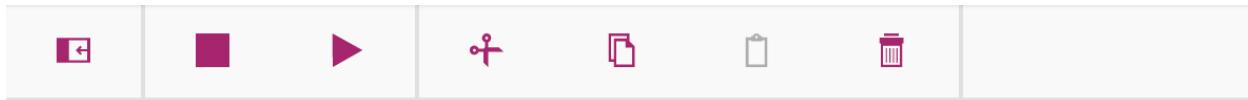

Step 2.3 Explore the Data using Graph Nodes.

The SPSS desktop version has a rich graphical icon set. Currently, the DSX version has only 4 graph nodes in the beta version. The Distribution node, and the Histogram node will be used to explore some of the characteristics of the Titanic Data Set. First, we will add a Type node to the canvas. The Type node specifies field metadata and properties. We will change the measurement

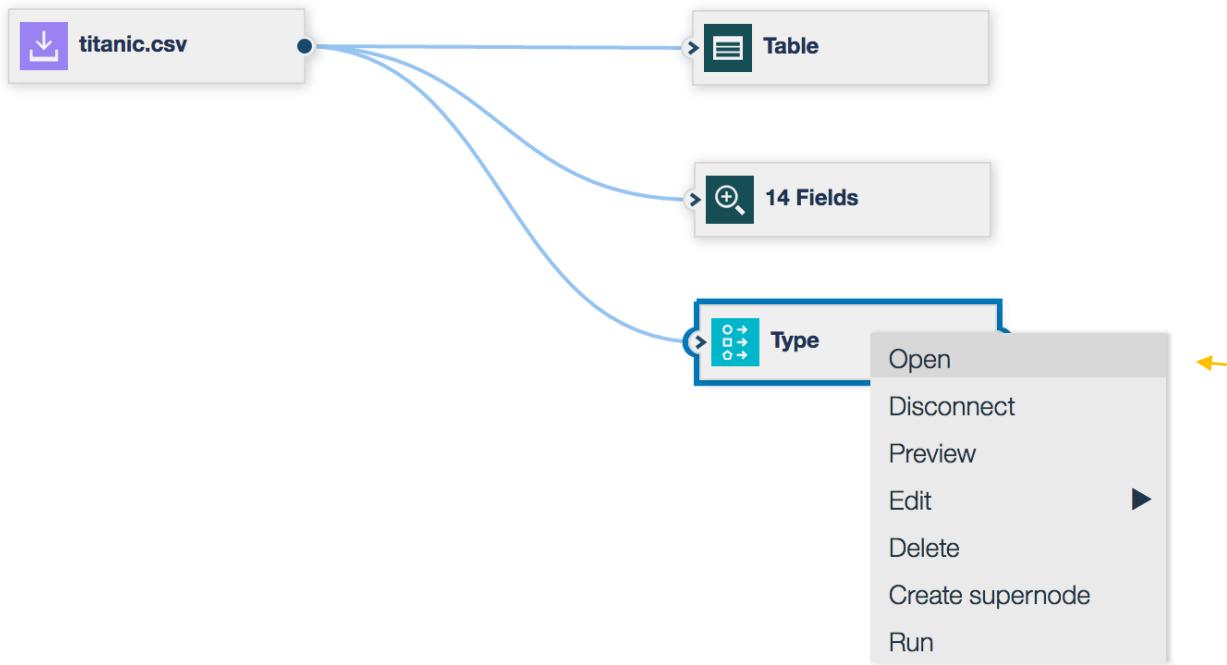

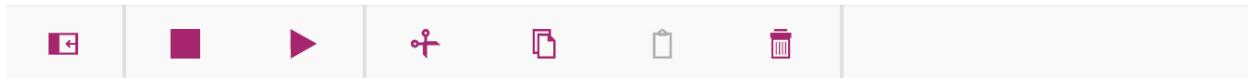

property for the “pclass” and “survived fields” that was derived as “Continuous” by scanning the data values to “Ordered Set” and “Flag” respectively.

1. Add a **Type** node to the flow by clicking on the **Field Operations** menu item in the Node Palette and then drag the **Type** node underneath the **Data Audit** node. If the Node Palette is not visible, click on the Node Palette icon . Connect the titanic.csv node to the **Type** node. The canvas should appear as below.

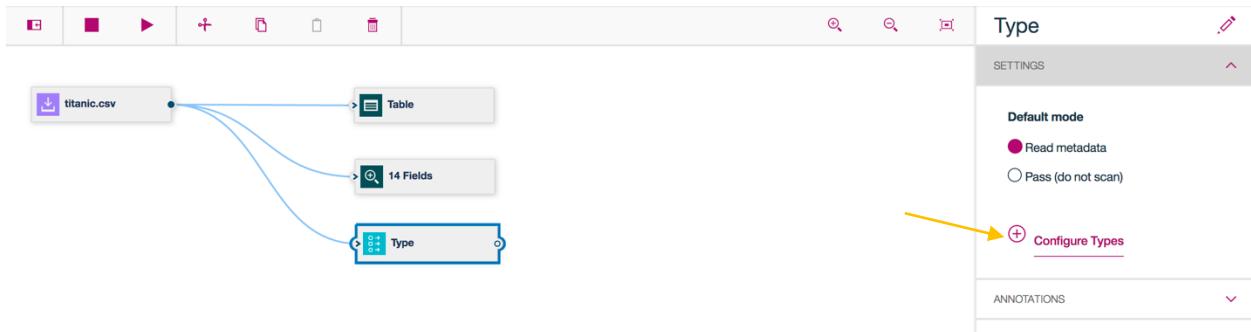

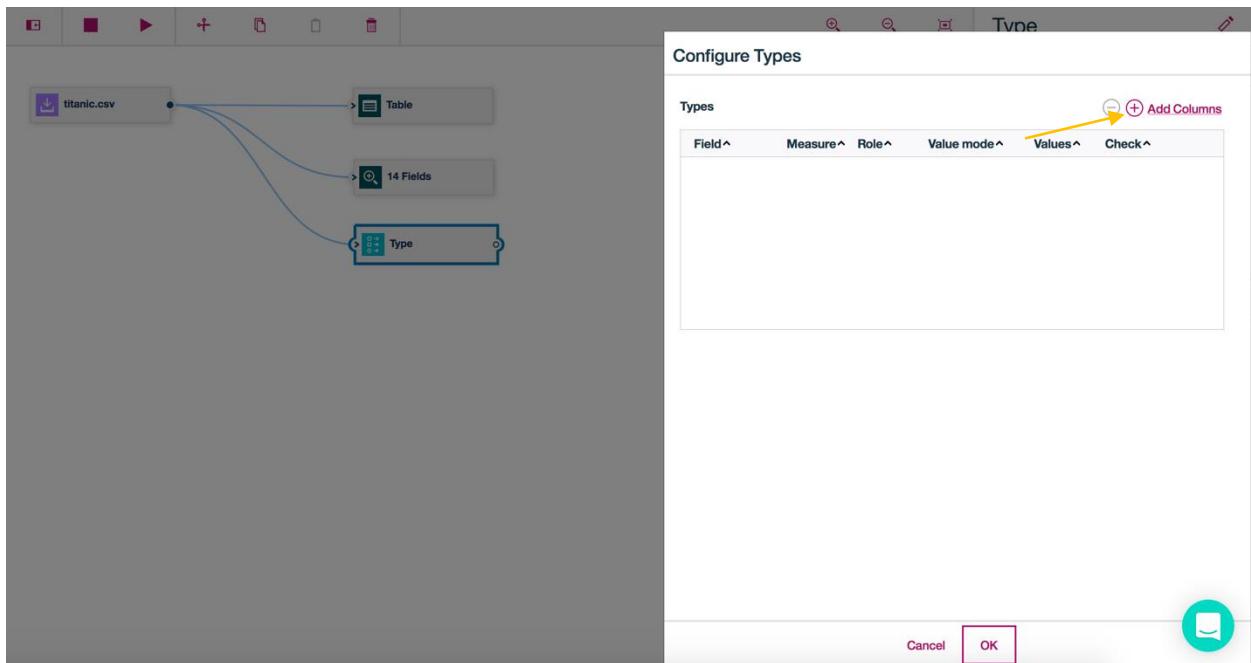

2. Double click on the **Type** node. This will open a **Type** menu pallet on the right side of the screen.

3. Click on the **Settings** dropdown. Select **Configure Types**.

4. Select **Add Columns**.

5. Click on the checkboxes adjacent to the **pclass** and **survived** **fields**, and then click on the left arrow next to **Select Fields for Type**.

Select Fields for Type

Search in column Field name 

Filter:  [Reset](#) 

	Field name ^	Data type ^
<input type="checkbox"/>	pclass	 integer
<input checked="" type="checkbox"/>	survived	 integer
<input type="checkbox"/>	name	 string

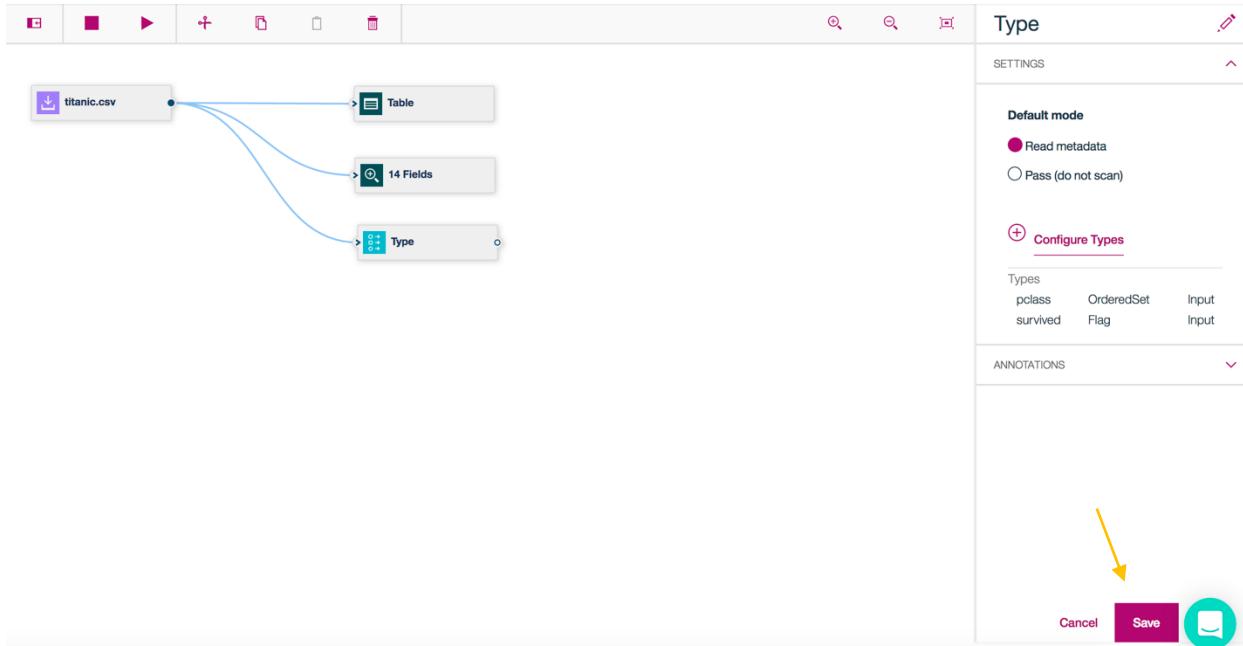

6. Click on the measurement level field for **pclass** and select **Ordered Set**. Click on the measurement level field for **survived** and select **Flag**. Click on **OK**.

Configure Types

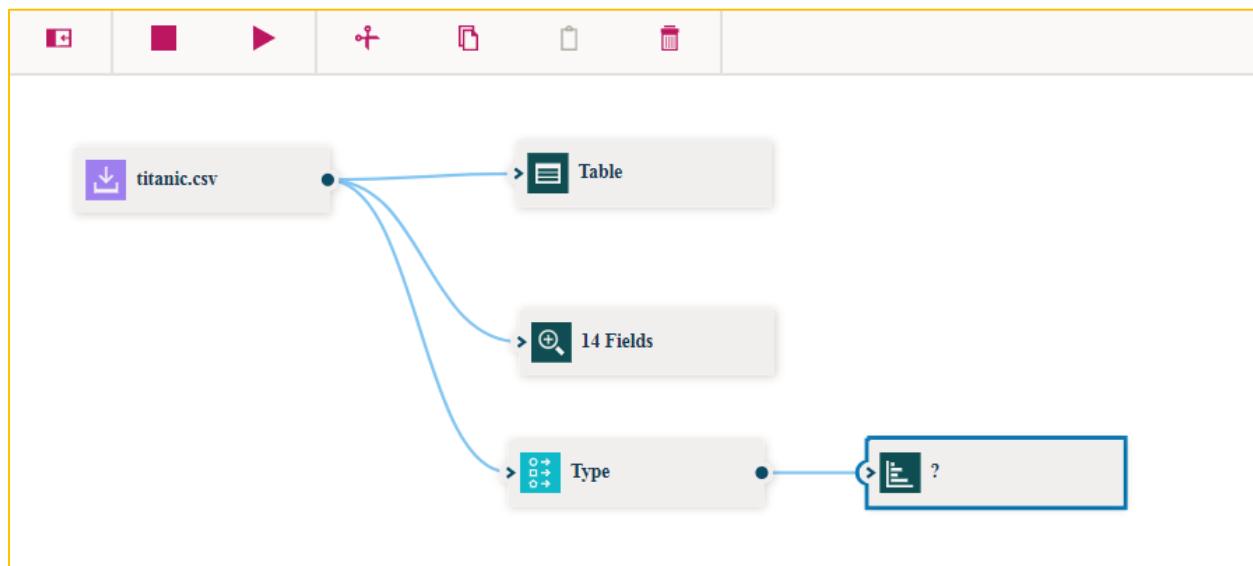

Field ^	Measure ^	Role ^	Value mode ^	Values ^	Check ^
pclass	Ordered Set	Input	Read	None	...
survived	Flag	Input	Read	None	...

Cancel OK 

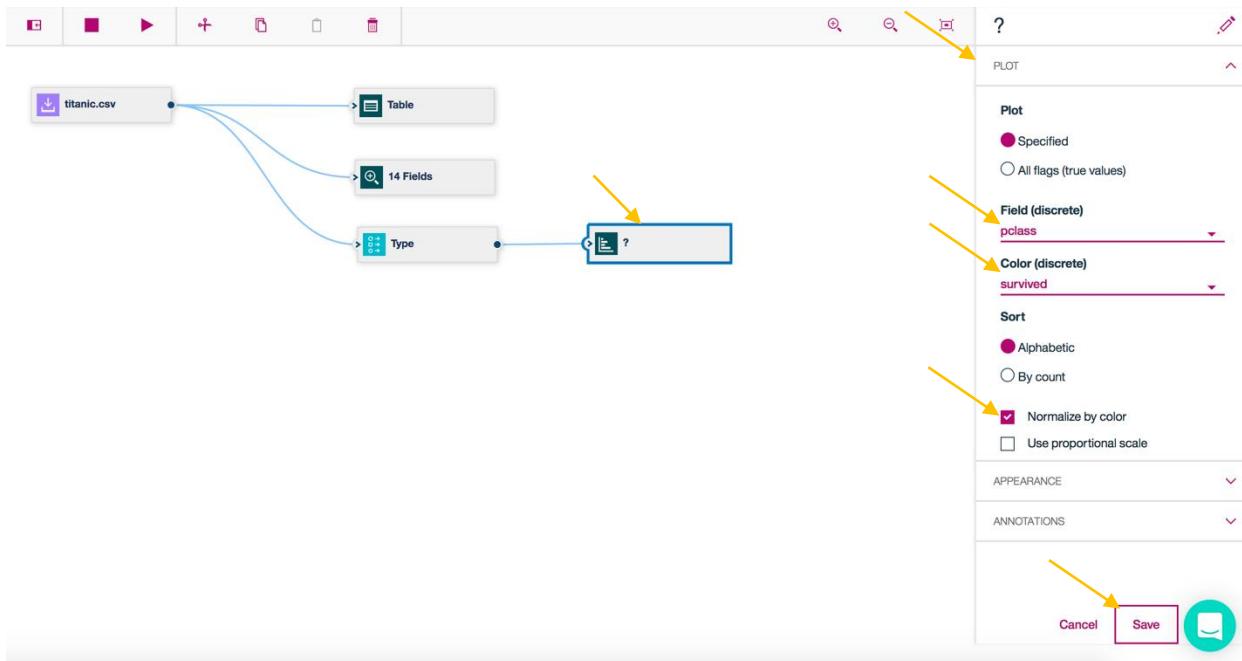

7. Click on **Save** in the bottom right of the Types pallet.

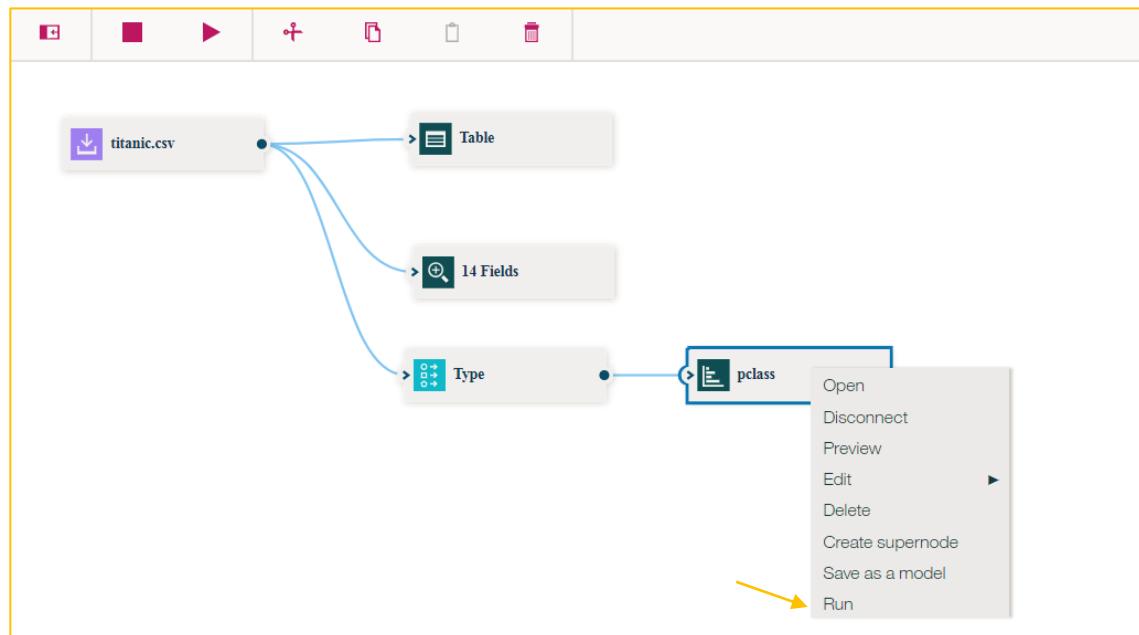

8. Add a **Distribution** node to the flow by clicking on the **Graph** menu item and then dragging the **Distribution** node to the canvas to the right of the **Type** node. If the Node Palette is not visible, click on the Node Palette icon . Connect the **Type** node to the **Distribution** node. The canvas should appear as below. The ? indicates that the fields to be plotted have not been identified.

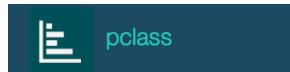

9. Double click on the Distribution Node. Click on the **Plot** dropdown. In the Field (discrete) dropdown, select **pclass**. In the Color (discrete) dropdown, select **survived**. Click on the **normalize by color** checkbox, and then click **Save**.

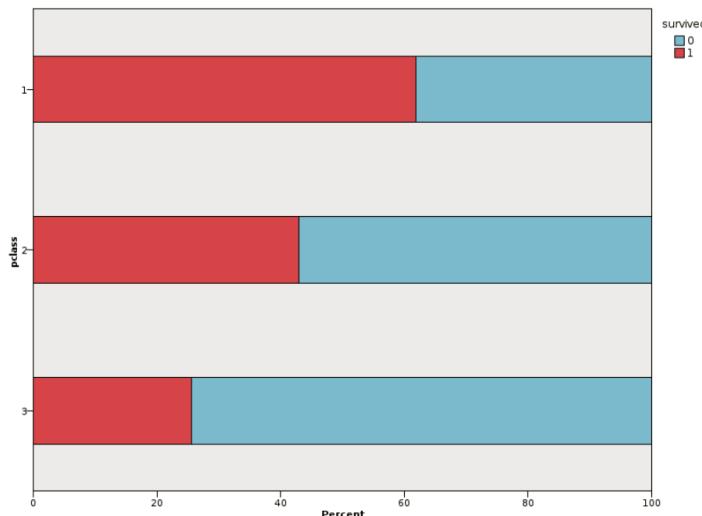

10. Right click on the Distribution node, and select Run.

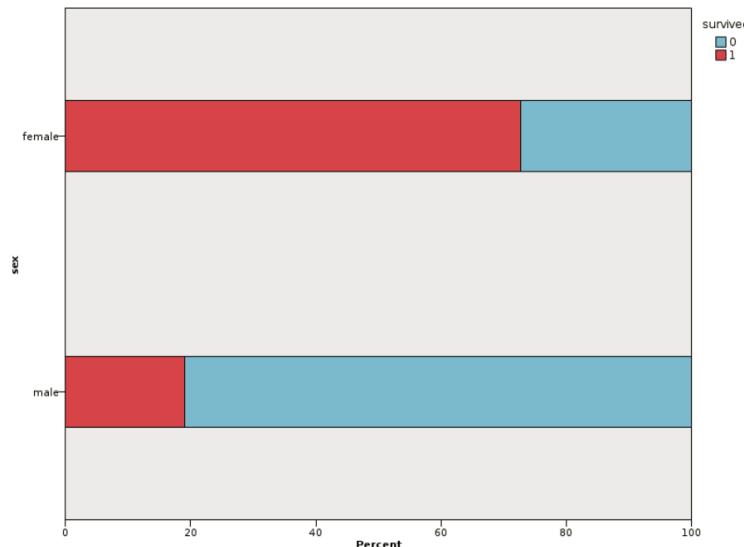

11. The Distribution of pclass output will appear under the **Outputs** tab.

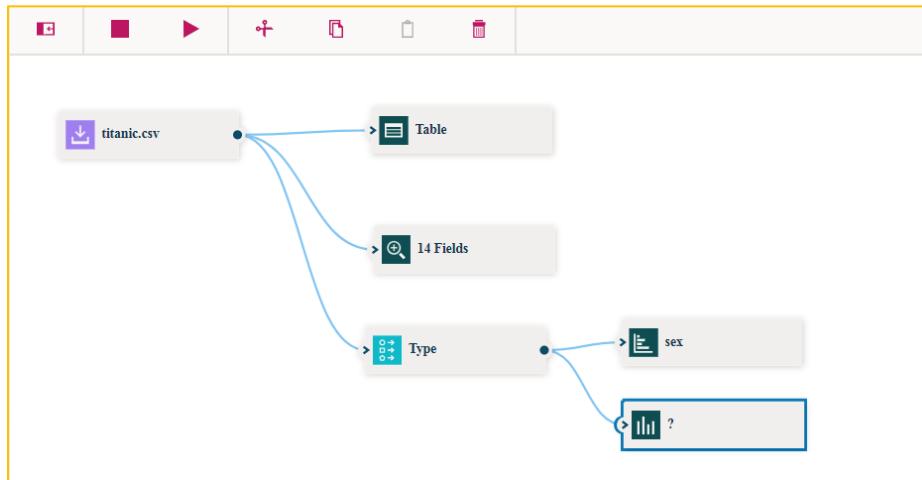

12. Double click on the **Distribution of pclass #1** to view the graph. We can see from the graph that the likelihood of surviving is correlated to the passenger class. The first class passengers have the highest rate of survivability.

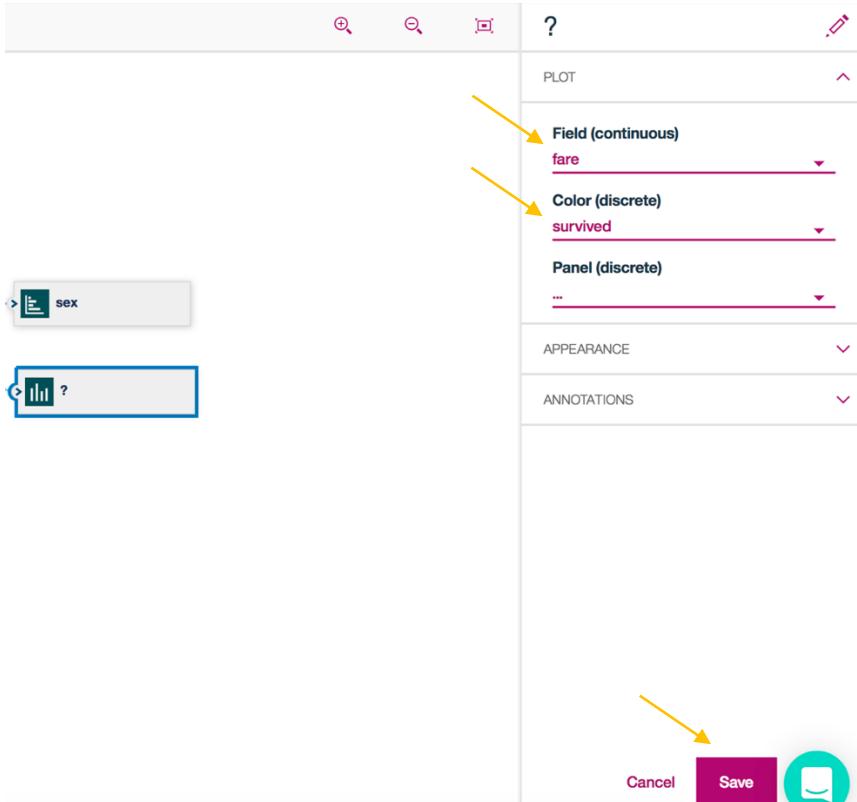

13. You can change the distribution graph to show the survivability by gender by double clicking on the Distribution node and replacing pclass with sex and clicking Save. Re-run the graph by right clicking on the Distribution node and selecting Run. Double click on the Distribution of sex #1 to display the graph.

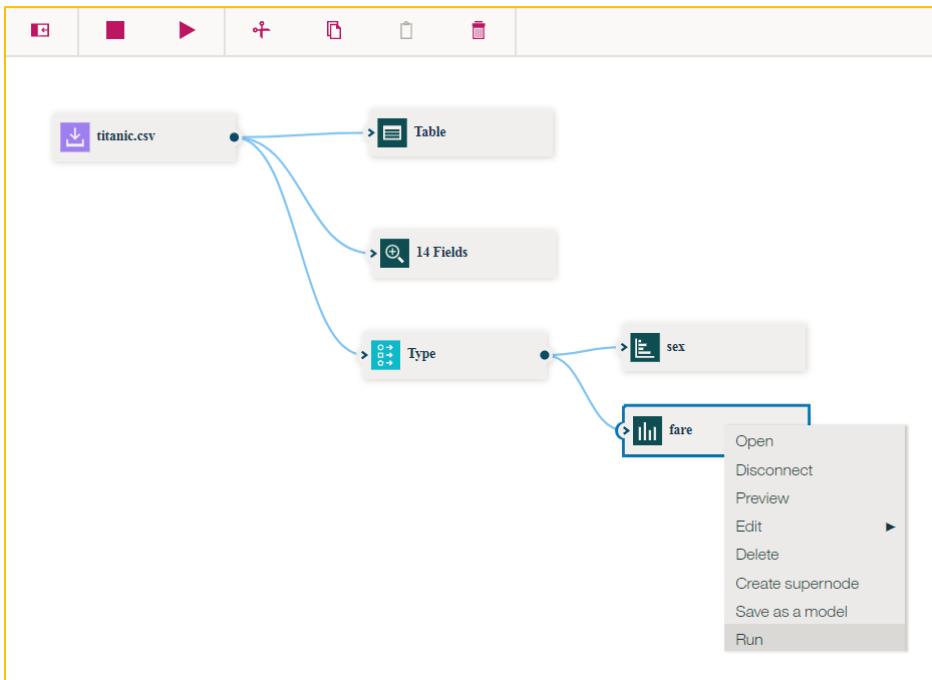

14. Add a **Histogram** node to the flow by clicking on the **Graphs** menu item and then dragging the **Histogram** node to the canvas underneath the **Distribution** node. If the Node Palette is not visible, click on the Node Palette icon . Connect the **Type** node to the **Histogram** node. The canvas should appear as below. The ? indicates that the fields to be plotted have not been identified.

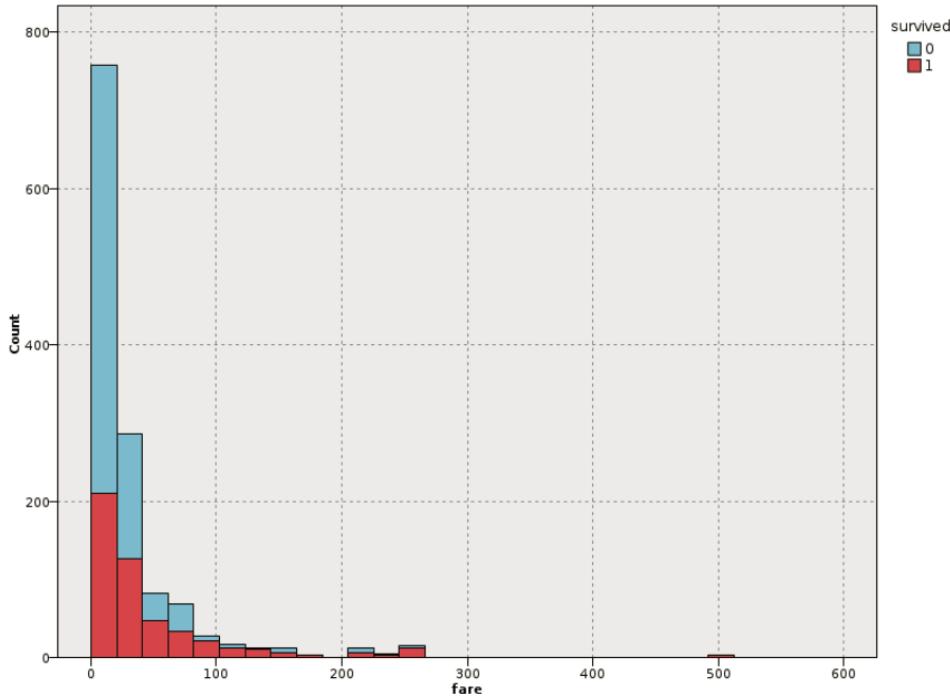

15. Double click on the **Histogram** node. Click on the **Plot** dropdown. Select **fare** from the Field (continuous) dropdown. Select **survived** from the Color (discrete) dropdown. Click on **Save**.

16. Right click on the **Histogram** node and select **Run**.

17. Double click on the Histogram of fare **Histogram of fare** under the Outputs tab at the right of the screen.

18. We can see that the histogram is skewed. Skewness will impact the effectiveness of some machine learning techniques. One way to deal with skewness is to do a logarithmic transformation of the data. We will do this transformation in the preparing the data for modeling section below.

Step 2.4 Prepare the Data for Modeling

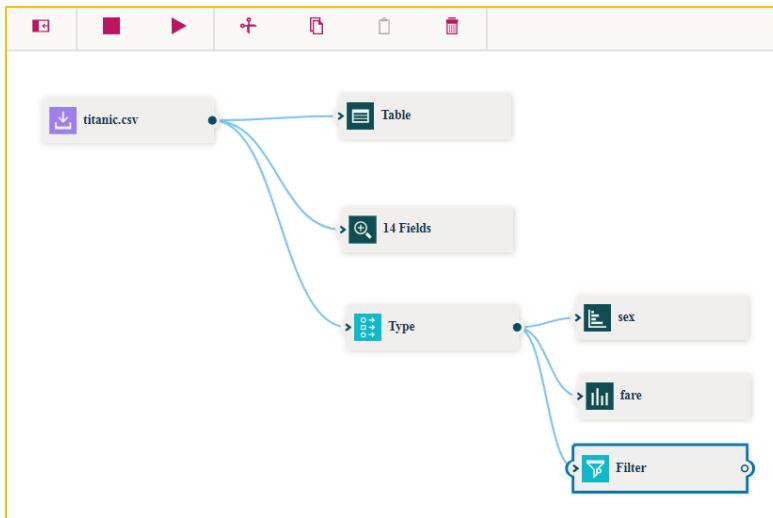

Based on our exploration of the data, there are several transformations that are needed to prepare the data for modeling. This section will introduce, the Filter node, the Select node, and the Derive node that will do the necessary transformations. The Filter and Derive nodes act on a field level, whereas the Select node acts on a record level.

Filter node – The Filter node performs two functions. It specifies fields that can be dropped. It also allows fields to be renamed. We will drop the fields cabin,boat,body, and home.dest.

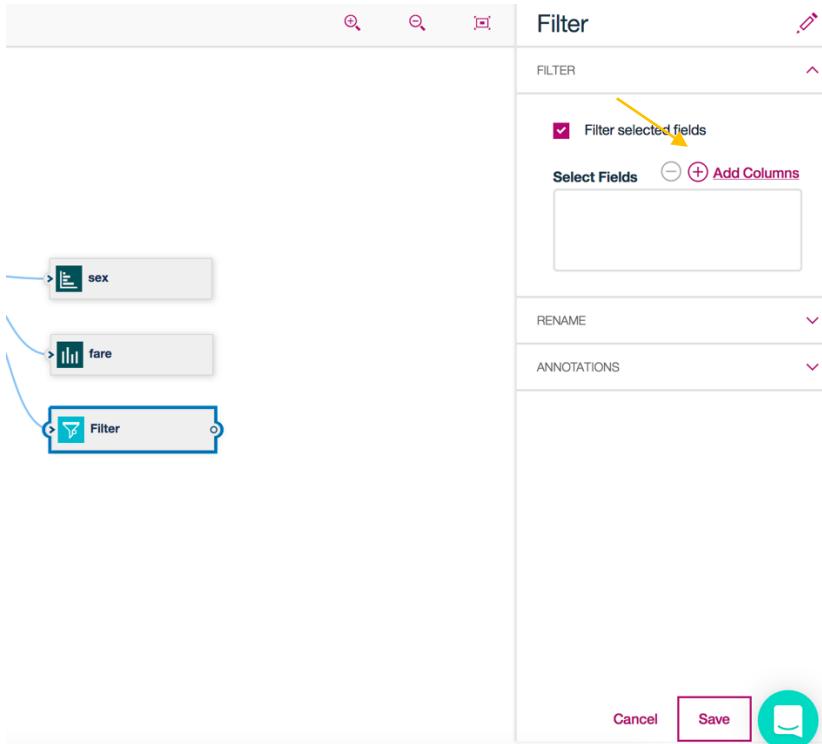

Derive node – The Derive node modifies data values or creates new fields from one or more existing fields. We will use the derive node to do a logarithmic transformation of the fare field. We will also use this node to bin the age and fare fields.

Select node – The Select node is used to select or discard a subset of records from the data stream based on a specific condition. We will remove the rows where there are missing information in the fare, age, or embarked fields.

1. Add a **Filter** node to drop fields with many missing values. Add the **Filter** node by clicking on the **Field Operations** menu item in the Node palette and dragging the **Filter** node onto the canvas underneath the fare **Histogram** node. If the Node Palette is not visible, click on the Node Palette icon  first. The canvas should appear as below.

2. Double click on the **Filter** node. Click on the **Filter** dropdown. In the Filter panel, click on **Add Columns**.

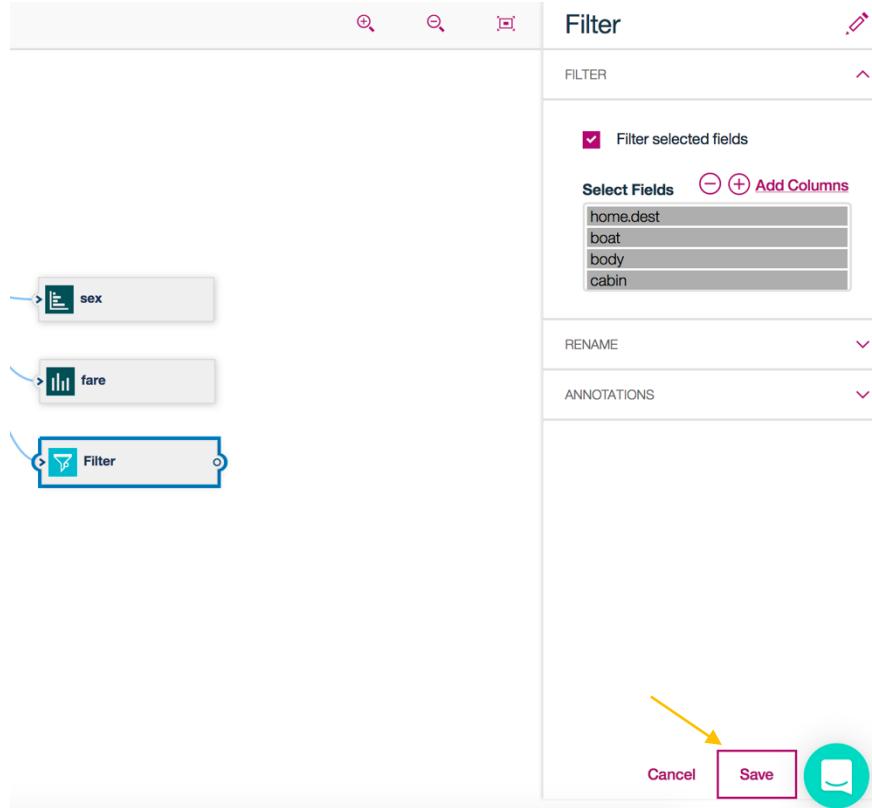

3. Click on the checkboxes adjacent to the **cabin**, **boat**, **body**, and **home.dest** fields, and then click on **Select Fields for Filter**.

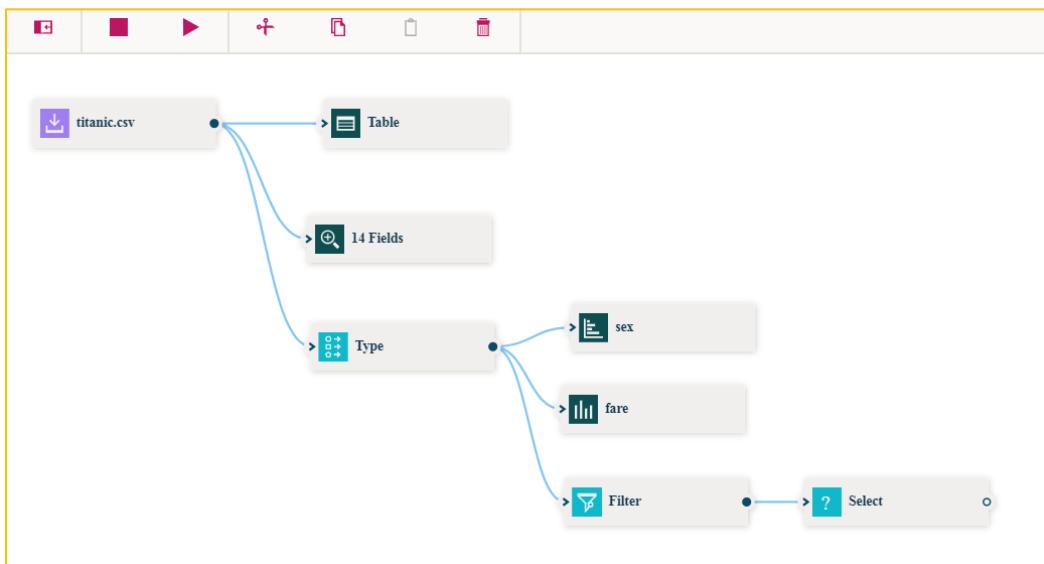

The screenshot shows the 'Select Fields for Filter' dialog box. It has a search bar at the top labeled 'Search in column Field name' with a magnifying glass icon. Below the search bar is a table with two columns: 'Field name' and 'Data type'. The 'Field name' column contains a list of fields: pclass, survived, name, sex, age, sibsp, parch, ticket, fare, cabin, embarked, boat, body, and home.dest. The 'Data type' column shows the data type for each field. There are checkboxes next to each field name. Yellow arrows point to the checkboxes for 'cabin', 'boat', 'body', and 'home.dest', all of which are checked. At the top right of the dialog is a 'Reset' button with a circular arrow icon. At the bottom right is a green circular 'Save' button.

	Field name ^	Data type ^
<input type="checkbox"/>	pclass	◊ integer
<input type="checkbox"/>	survived	◊ integer
<input type="checkbox"/>	name	■ string
<input type="checkbox"/>	sex	■ string
<input type="checkbox"/>	age	◊ double
<input type="checkbox"/>	sibsp	◊ integer
<input type="checkbox"/>	parch	◊ integer
<input type="checkbox"/>	ticket	■ string
<input type="checkbox"/>	fare	◊ double
<input checked="" type="checkbox"/>	cabin	■ string
<input type="checkbox"/>	embarked	■ string
<input checked="" type="checkbox"/>	boat	■ string
<input checked="" type="checkbox"/>	body	◊ integer
<input checked="" type="checkbox"/>	home.dest	■ string

4. Click **Save** on the Filter panel.

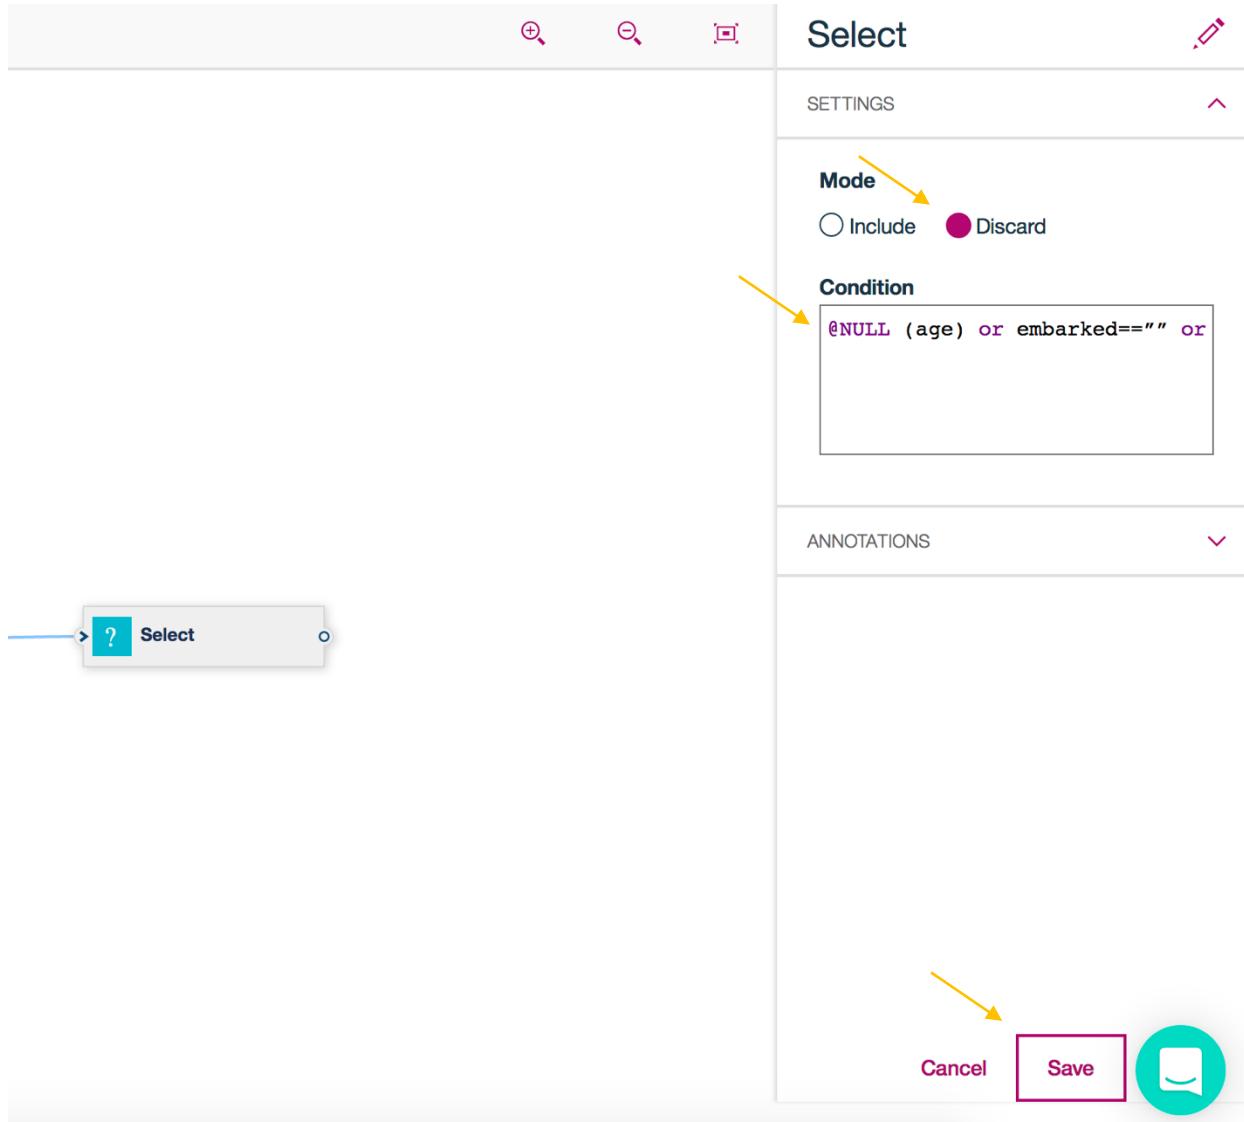

5. Add a **Select** node by clicking on the **Record Operations** menu item in the Node palette, and then dragging the **Select** node to the canvas to the right of the **Filter** node. Connect the **Filter** node to the **Select** node. If the Node Palette is not visible, click on the Node Palette icon first. The canvas should appear as below.

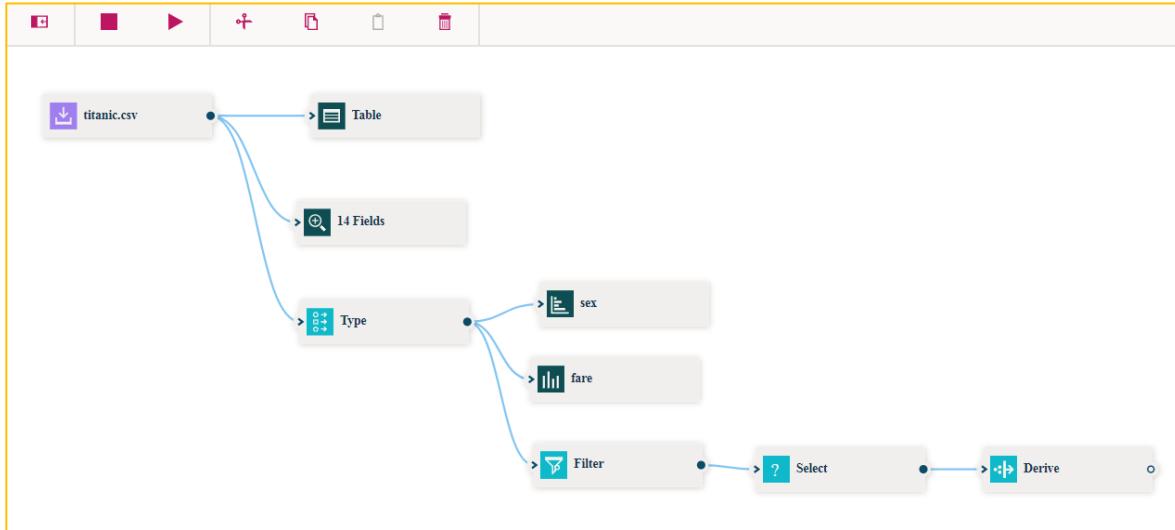

6. Double click on the **Select** node. Click on the **Settings** dropdown. In the **Select** panel, click on the **Discard** radio button, and re-type in the code shown below in the **Condition text box**, and then click **Save**.

@NULL (age) or embarked=="" or @NULL(fare)

7. Add a **Derive** node to the canvas by clicking on the **Field Operations** menu item in the Node palette, and then dragging the **Derive node** onto the canvas to the right of the **Select** node. If the Node Palette is not visible, click on the Node Palette icon  first. Connect the **Select** node to the **Derive** node. The canvas should appear as below.

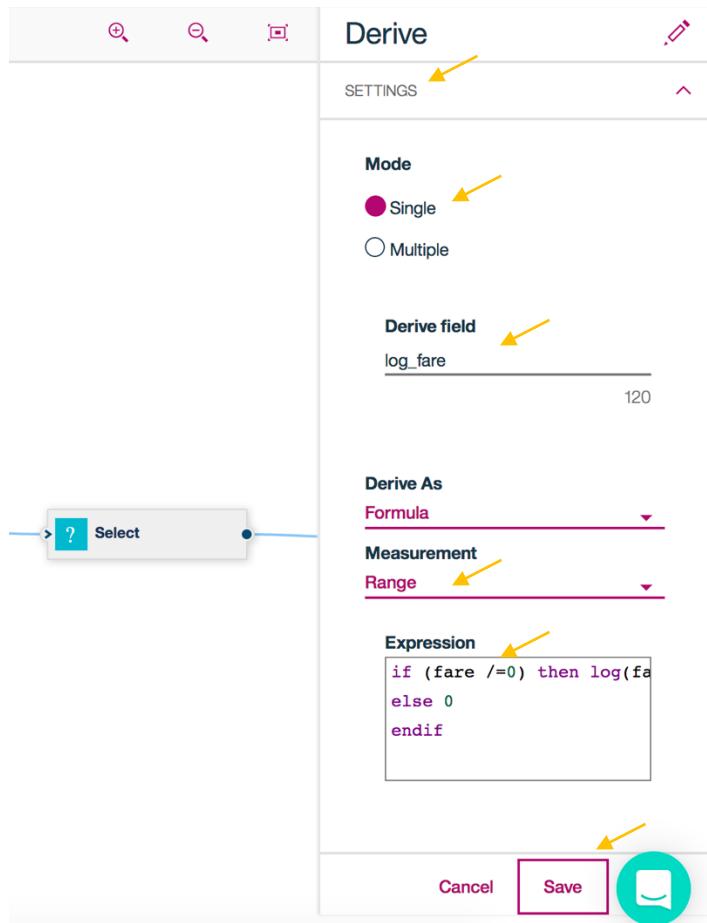

8. Double click on the **Derive** node. Click on the **Settings** Dropdown. Click on the **Single** radio button, enter log_fare for the **Derive field**, select **Range** for the measurement, enter the following code in the **Expression** text box, and click Save.

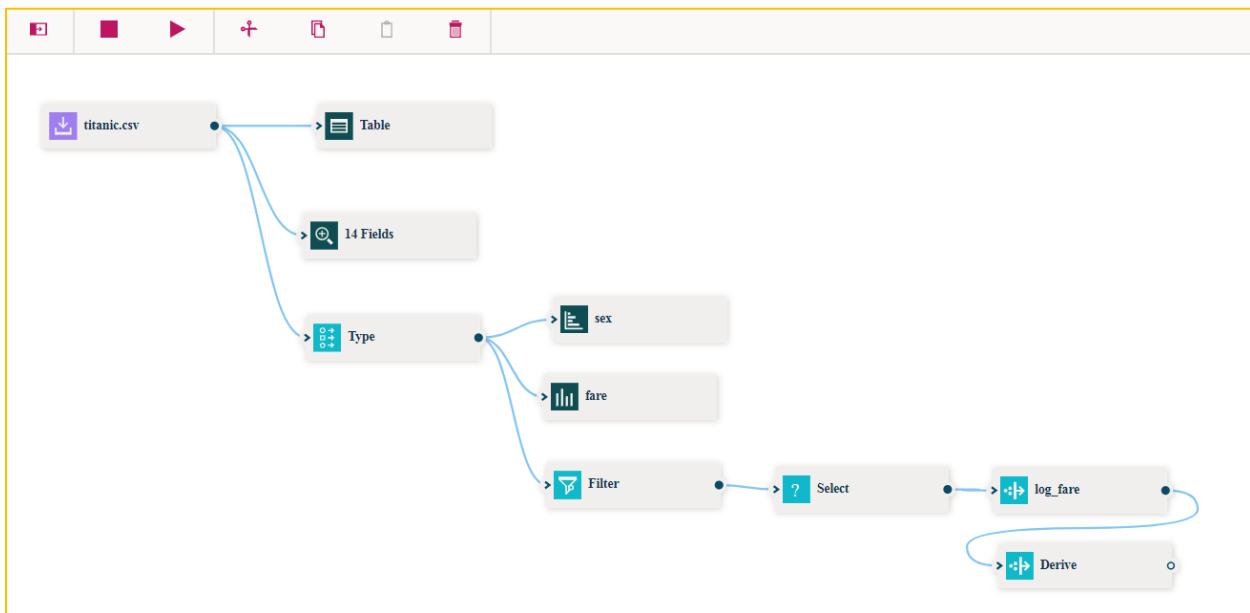

```
if (fare /=0) then log(fare)
```

```
else 0
```

```
endif
```

9. Binning of continuous fields is a technique sometimes used in preparing data for modeling. We will bin the age field, and the log_fare field. Add a **Derive** node by clicking on the **Field Operations** menu item in the Node palette and dragging the **Derive** node on the canvas underneath the log_fare **Derive** node. If the Node Palette is not visible, click on the Node Palette icon  first. Connect the log_fare **Derive** node to the newly added **Derive** node. The canvas should appear as below.

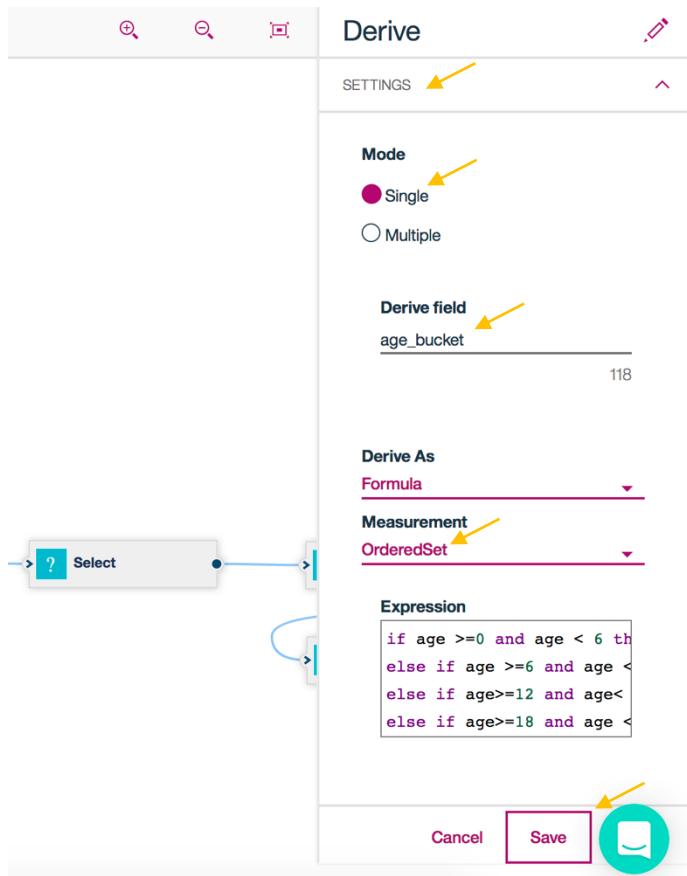

10. Double click on the **Derive** node. Click on the **Settings** dropdown. Click on the **Single** radio button, enter age_bucket for the **Derive field**, select **OrderedSet** for the **Measurement**, enter the following code in the **Expression** text box, and click **Save**.

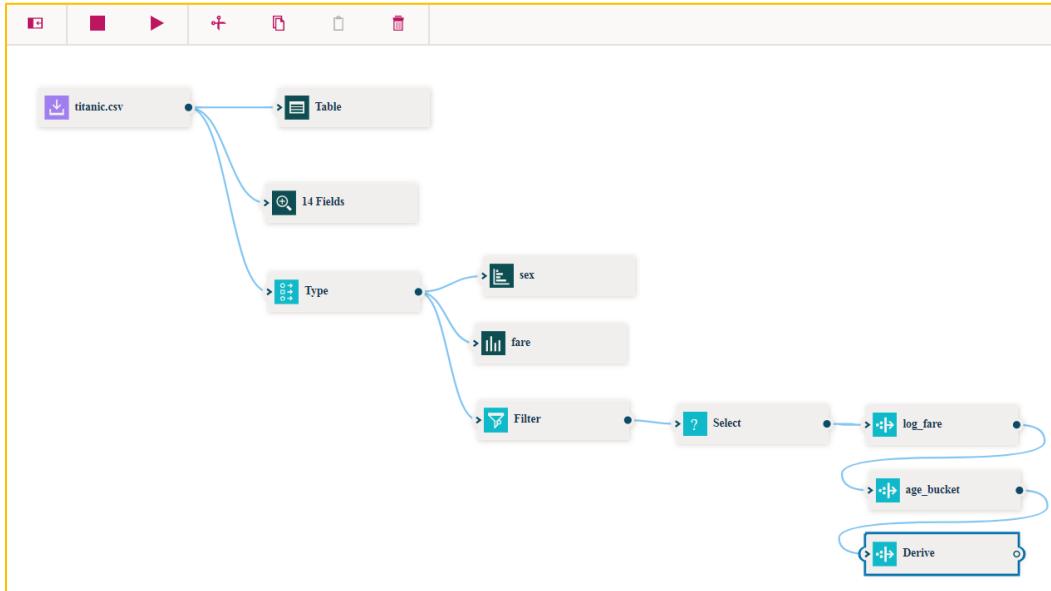

```

if age >=0 and age < 6 then 0
else if age >=6 and age < 12 then 1
else if age>=12 and age< 18 then 2
else if age>=18 and age <40 then 3
else if age>=40 and age <65 then 4
else if age>=65 and age<80 then 5
else 6
endif
endif
endif
endif
endif
endif
endif

```

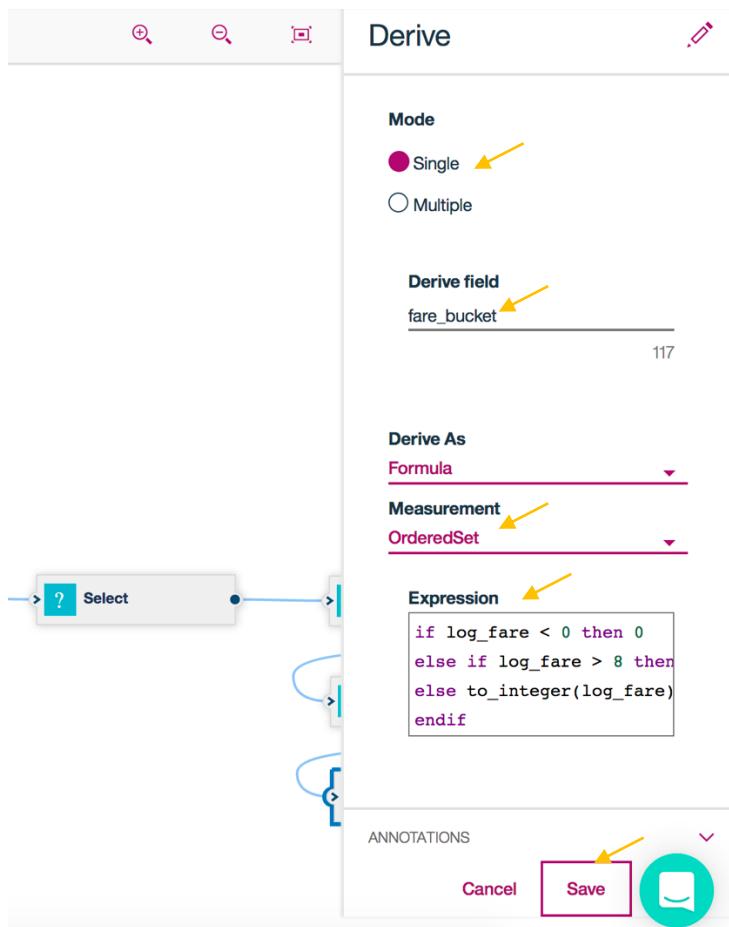

11. Add a **Derive** node by clicking on the Field Operations menu item in the Node palette and dragging the Derive node onto the canvas underneath the age_bucket Derive node. Connect the age_bucket Derive node to the newly created Derive Node. The canvas should appear as below.

12. Double click the **Derive** node. In the **Derive** panel, click on the **Single** radio button, enter **fare_bucket** in the **Derive field**, click on **OrderedSet** for the **Measurement**, enter the following code in the **Expression** text box, and click on **Save**.

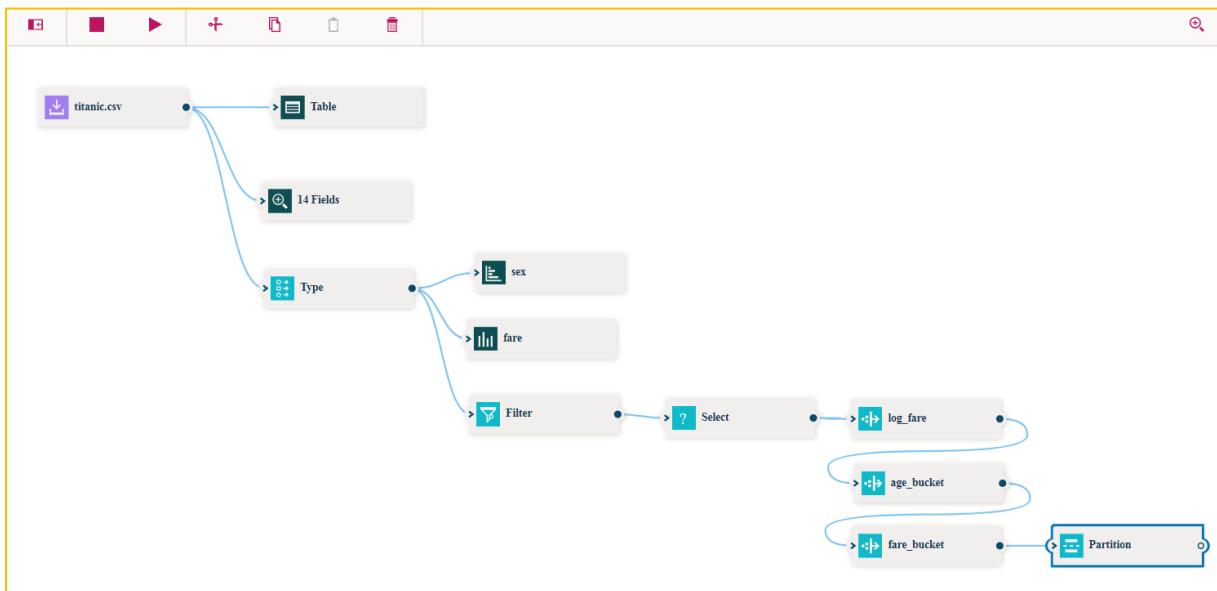

```
if log_fare < 0 then 0
else if log_fare > 8 then 9
else to_integer(log_fare)+1
endif
endif
```

Step 2.5 Modeling and Evaluation

Now that the data is prepared, we can start the modeling effort. First, we will add a **Partition** node to divide the data set into Training and Testing sets. In addition, a **Type** node is needed prior to modeling to type the new data fields that were created. Then we will add a **Logistic Regression** node, and use the Training set to train the model. Finally, we will add an **Analysis** node to evaluate the results.

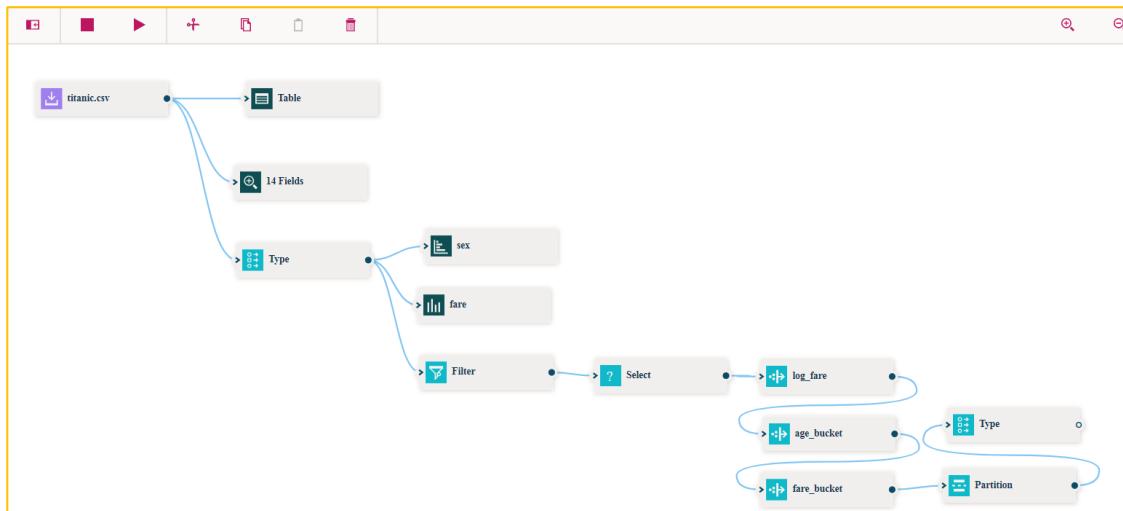

1. Add a **Partition** node by clicking on the Field Operations menu item in the Node palette and dragging the **Partition** node onto the canvas to the right of the fare_bucket **Derive** node. Connect the fare_bucket **Derive** node to the **Partition** node. The canvas should appear as below.

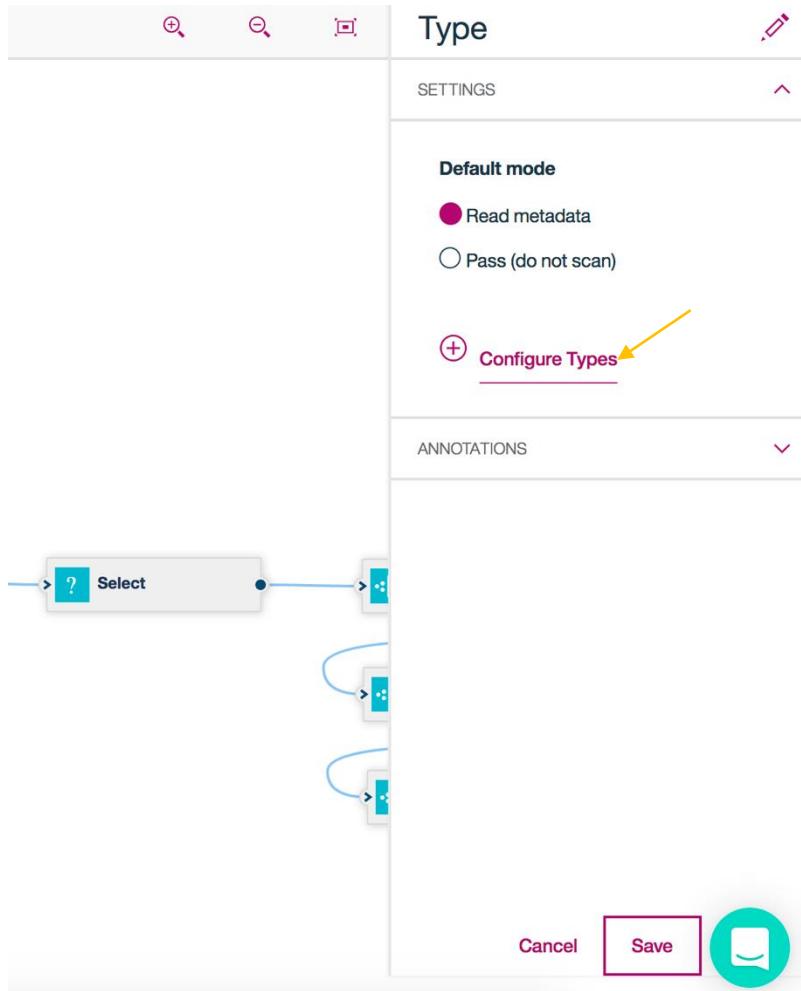

2. Double click on the Partition node. Set the **Training Partition** to 70 and the **Test Partition** to 30. Leave the other defaults, and click on **Save**.

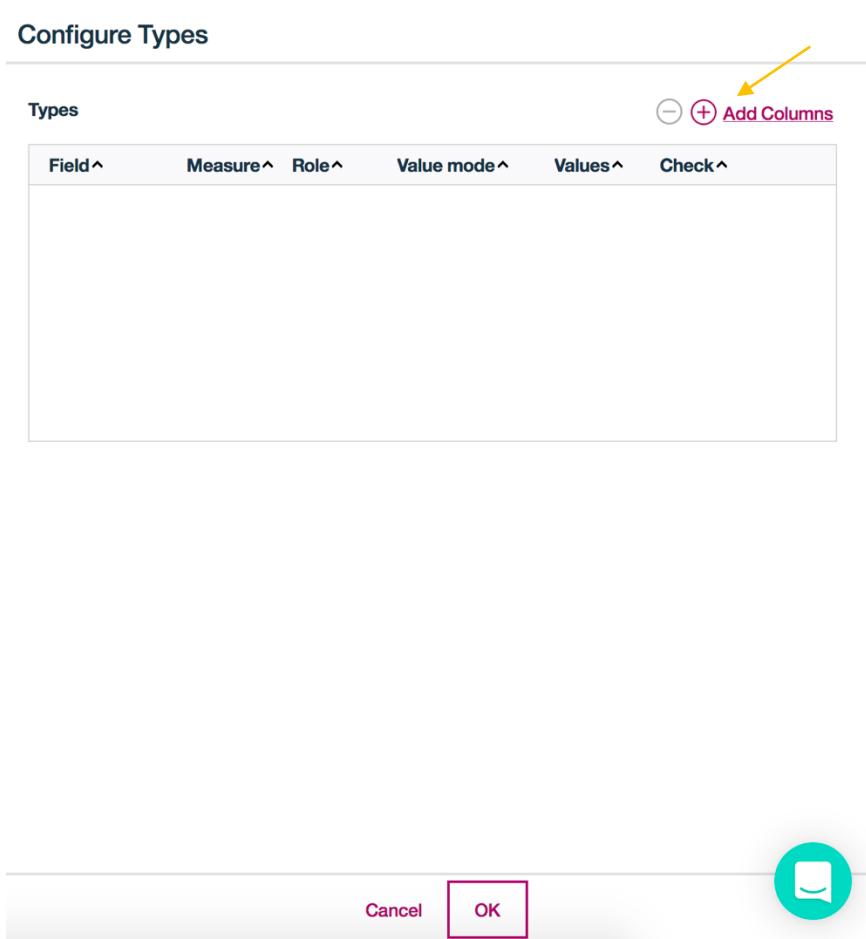

3. Add a **Type** node by clicking on the **Field Operations** in the Node palette and dragging the **Type** node onto the canvas above the **Partition** node. Connect the **Partition** node to the **Type** node. The canvas should appear as below.

4. Double click on the **Type** node. Click on **Configure Types**.

5. Click on **Add Columns**.

6. Click on checkboxes adjacent to the **log_fare**, **age_bucket**, **fare_bucket**, and **Partition** fields (You may need to scroll down). Click on **Select Fields for Type**.

Select Fields for Type

Search in column Field name Filter:

	Field name	Type
<input type="checkbox"/>	name	string
<input type="checkbox"/>	sex	string
<input type="checkbox"/>	age	double
<input type="checkbox"/>	sibsp	integer
<input type="checkbox"/>	parch	integer
<input type="checkbox"/>	ticket	string
<input type="checkbox"/>	fare	double
<input type="checkbox"/>	cabin	string
<input type="checkbox"/>	embarked	string
<input type="checkbox"/>	boat	string
<input type="checkbox"/>	body	integer
<input type="checkbox"/>	home.dest	string
<input checked="" type="checkbox"/>	log_fare	double
<input checked="" type="checkbox"/>	age_bucket	integer
<input checked="" type="checkbox"/>	fare_bucket	integer
<input checked="" type="checkbox"/>	Partition	string

7. For the **Partition** field, select **Set** for the **Measurement**. For the **log_fare**, select **Range** for the **Measurement**. For the **fare_bucket** field, select **OrderedSet** for the **Measurement**, and for the **age_bucket**, select **OrderedSet** for the **Measurement**, and click **OK**.

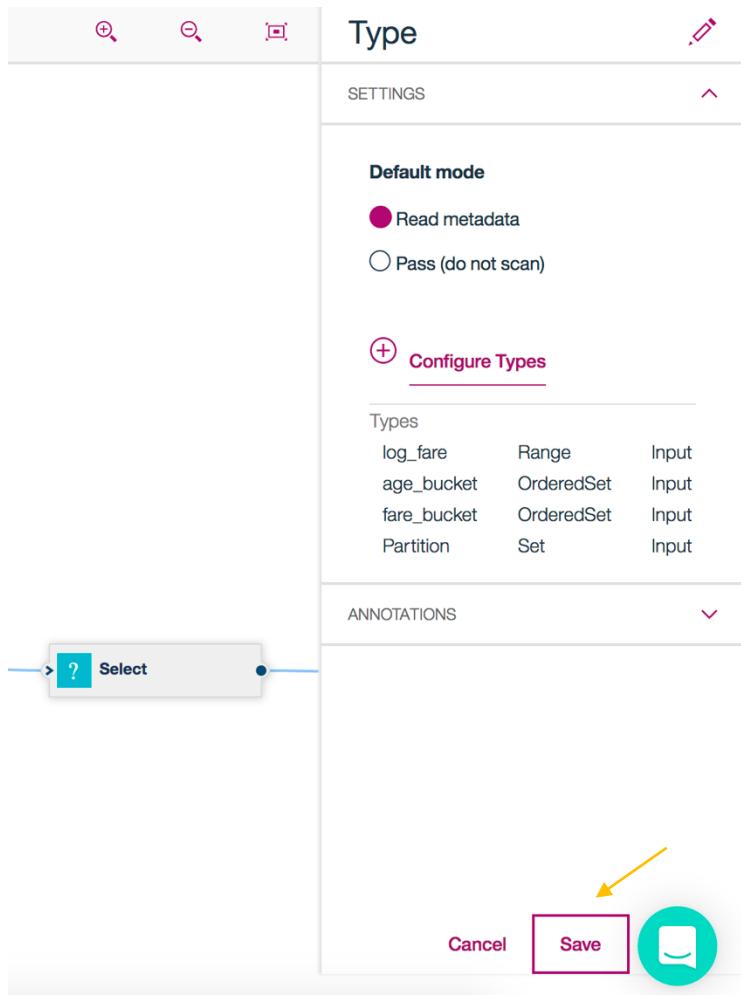

Configure Types

Types					
Field ^	Measure ^	Role ^	Value mode ^	Values ^	Check ^
log_fare	Range	Input	Read	None	...
age_bucket	Ordered Set	Input	Read	None	...
fare_bucket	Ordered Set	Input	Read	None	...
Partition	Set	Input	Read	None	...

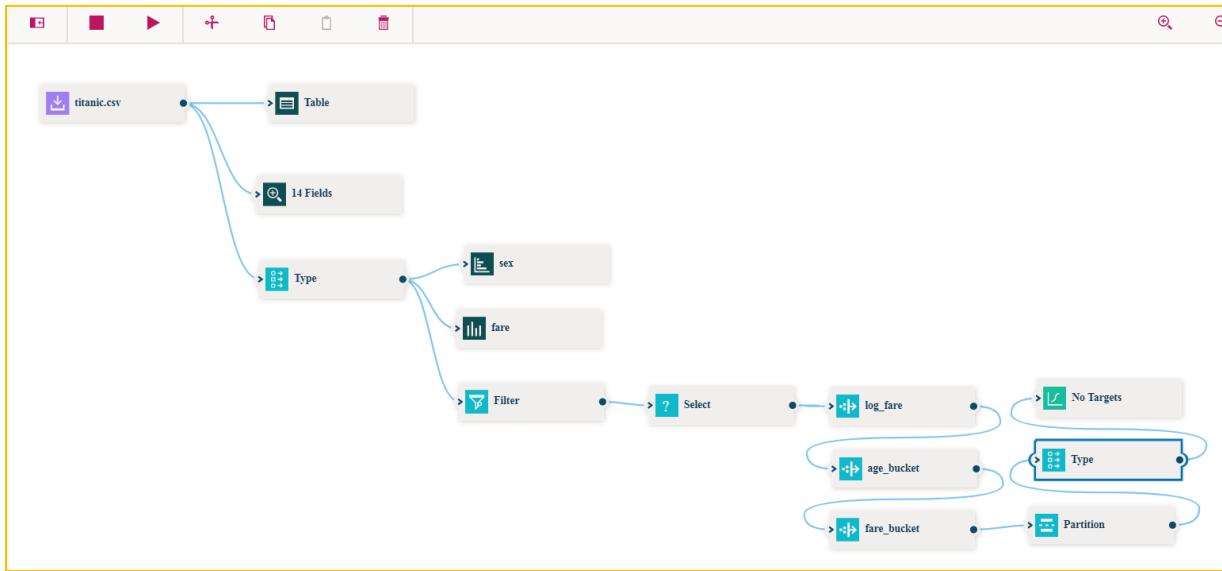

Cancel **OK** 

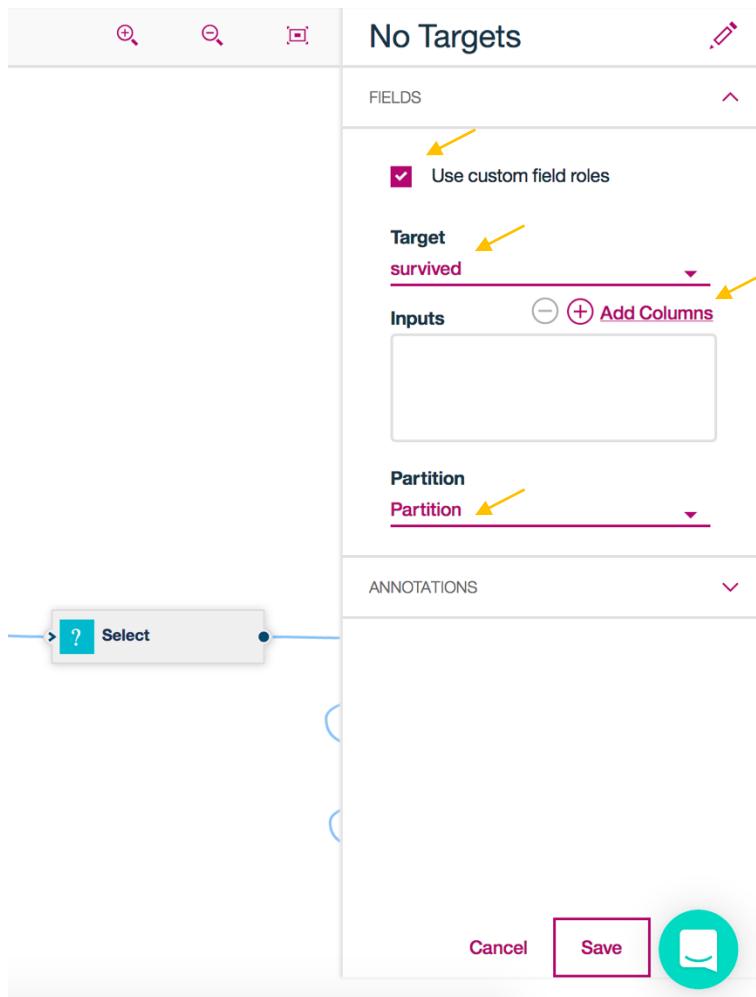

8. Click on **Save**

9. Add a **Logistic Regression** node by clicking on the **Modeling** menu item in the Node palette and dragging the **Logistic** node onto the canvas above the **Type** node. Connect the **Type** node to the **Logistic Regression** node. The canvas should appear as below.

10. Double click on the **Logistic Regression** node. Click on the checkbox next to **Use custom field roles**, select **survived** for the **Target**, select **Partition** for the **Partition**, and click on **Add Columns** to add the input fields.

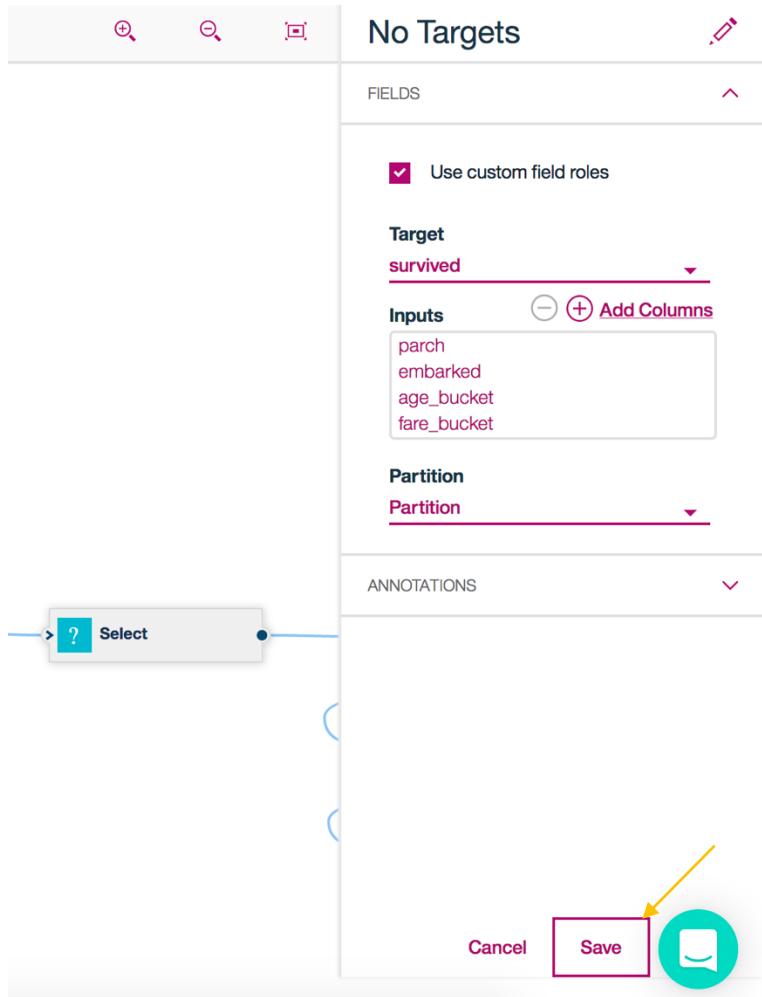

11. Click on the checkboxes next to pclass, sex, sibsp, parch, embarked, age_bucket, fare_bucket fields (you may have to scroll down), and then click the arrow to the left of the **Select Fields for No Targets**.

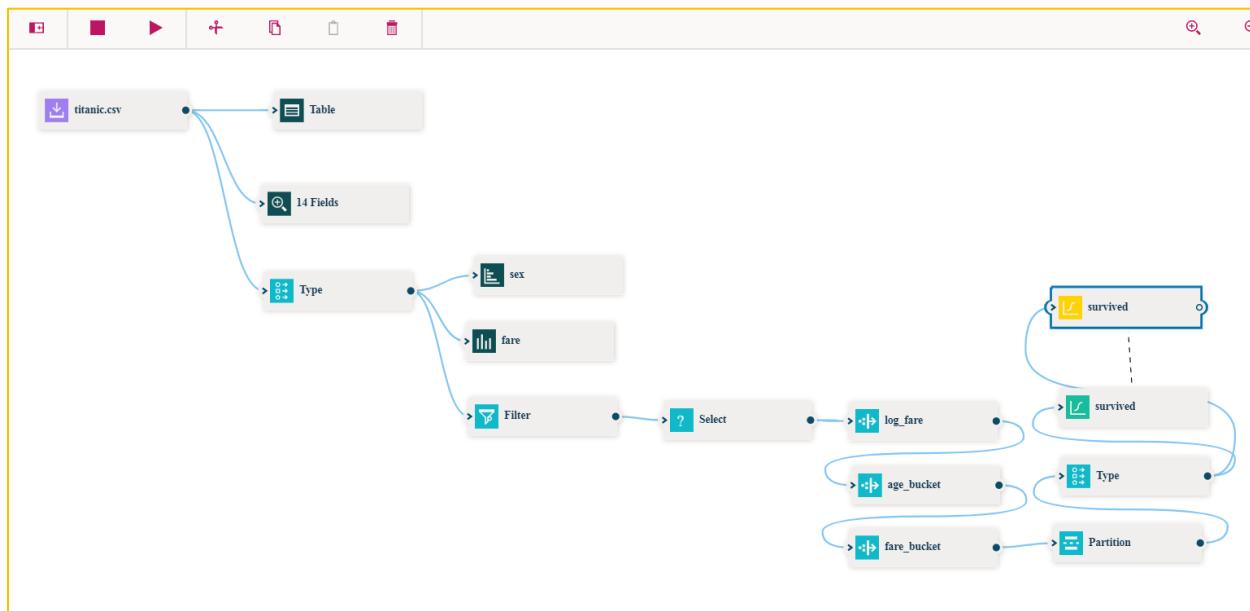

Select Fields for No Targets	
<input type="checkbox"/>	Search in column Field name
<input checked="" type="checkbox"/>	pclass
<input type="checkbox"/>	name
<input checked="" type="checkbox"/>	sex
<input type="checkbox"/>	age
<input checked="" type="checkbox"/>	sibsp
<input checked="" type="checkbox"/>	parch
<input type="checkbox"/>	ticket
<input type="checkbox"/>	fare
<input type="checkbox"/>	cabin
<input checked="" type="checkbox"/>	embarked
<input type="checkbox"/>	boat
<input type="checkbox"/>	body
<input type="checkbox"/>	home.dest
<input type="checkbox"/>	log_fare
<input checked="" type="checkbox"/>	age_bucket
<input checked="" type="checkbox"/>	fare_bucket

Filter:   

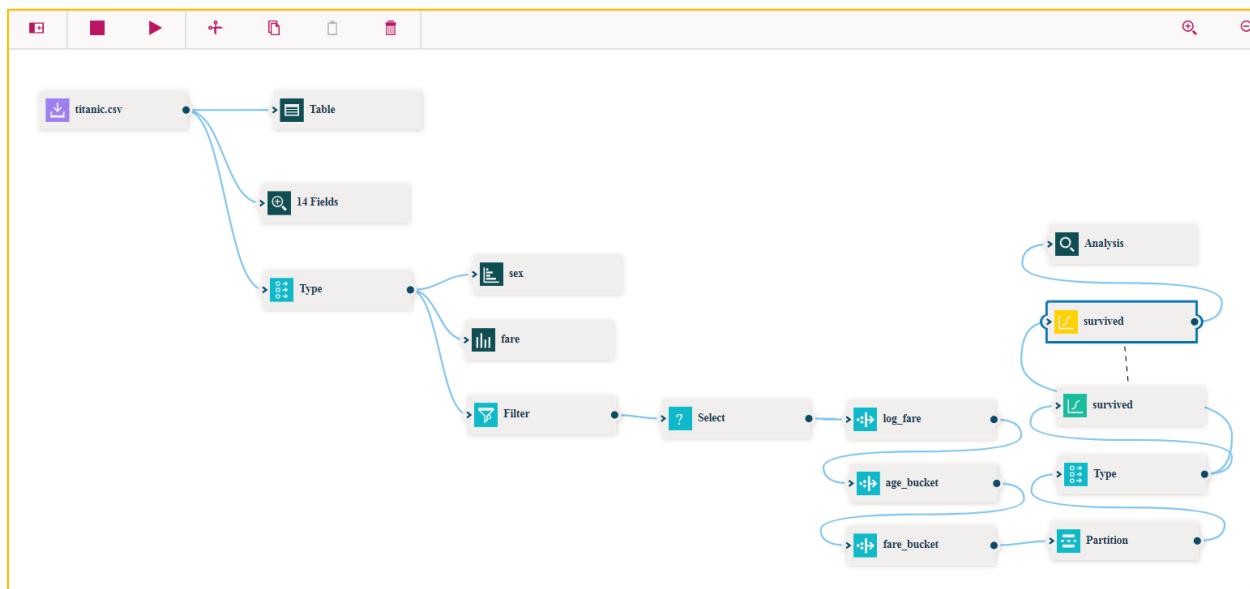

12. Click Save.

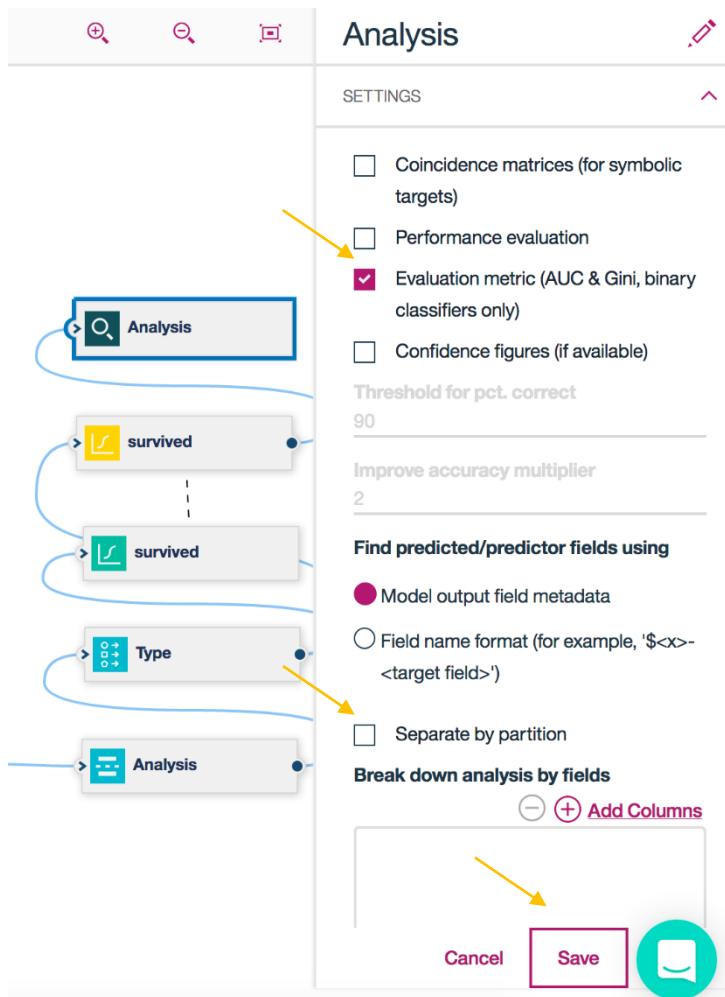

13. Right click on the **Logistic Regression** node and then click **Run**. A **Logistic Regression** “nugget will be created” connected by a dotted line to the **Logistic Regression** node. Drag the nugget and place it above the **Logistic Regression** node. The canvas should appear as below.

14. Add an **Analysis** node by clicking on the **Outputs** menu item in the Node palette and dragging the **Analysis** node onto the canvas above the nugget icon. Connect the nugget icon to the **Analysis** node. The canvas should appear as below.

15. Double click on the Analysis node. Click on the **Settings** dropdown. Click on the **Evaluation metric** checkbox, uncheck **Separate by partition**, and click on **Save**.

16. Right click on the Analysis node, and select Run. After completion, double click on the

link in the Outputs tab on the right side of the screen. The results should be similar to those shown below.

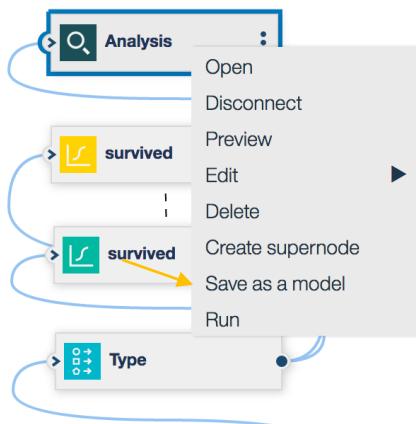

Results for output field survived			
Individual Models			
Comparing \$L-survived with survived			
Correct	828	79.39%	
Wrong	215	20.61%	
Total	1,043		

Evaluation Metrics			
Model	AUC	Gini	
\$L-survived	0.857	0.714	

Step 2.6 Saving a Model

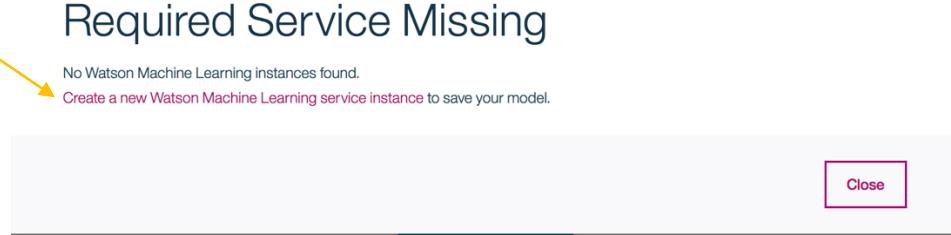

Now that we have created and evaluated a model, we will save the model as an asset. This saved model can be deployed at a future date, removing the need to recreate the same model from scratch.

1. Right click on the Analysis node and then click on **Save as a model**.

If you receive a “Required Service Missing” page, proceed to step 1.A. If you do not receive this page, proceed to step 2.

- 1.A. Click on “Create a new Watson Machine Learning service instance.”
-

1.B. Scroll down and click on “**Lite**” to select the Lite plan and then click on **Create**.

The screenshot shows the IBM Data Science Experience interface. At the top, there are links for Projects, Tools, Community, and Services. On the right, there are icons for US South, a document, a bar chart, a bell, and a user profile. Below the header, there are sections for SPSS analytics platform features, Spark and Python Machine Learning features, and Integration with Data Science Experience.

Pricing Plan: Monthly Process shown above reflect the: **United States**

Plan	Features	Pricing
<input checked="" type="radio"/> Lite	Service instance (5 models per instance) 5,000 predictions 5 compute hours	Free
<input type="radio"/> Standard	Predictions Compute hours	\$0.5 USD/1,000 predictions \$0.45 USD/hour
<input type="radio"/> Professional	Service instance 2,000,000 predictions included and then billed per 1,000 predictions 1,000 compute hours included and then billed per compute hour	\$1,000 USD/instance \$0.4 USD/1,000 predictions \$0.4 USD/hour

The Lite plan instance of the IBM Watson Machine Learning service provides you with a maximum of 5 deployed models, 5,000 predictions per month, and 5 hours per month of compute time during which model can be trained, evaluated, and deployed to be available to accept prediction events.

1.D. Return to your SPSS flow. Right click on the Analysis node and then click on **Save as a model**.

2. Type in “**TitanicSPSS**” as the Model Name and click **Save**.

The screenshot shows the 'Save Model' dialog box from IBM Data Science Experience. The 'Model Name' field is filled with 'TitanicSPSS'. The 'Machine Learning Service' dropdown is set to 'predictive-modeling-fj'. A note at the bottom states: 'The model will be saved to your DSX project. You can access your model and create deployment jobs from the Models section of Analytic Assets.' There are 'Cancel' and 'Save' buttons at the bottom, with a yellow arrow pointing to the 'Save' button.

3. Click **Close**.

4. Navigate to your project “assets” page. In this example, click on **Titanic-SPSS-Lab**.

The screenshot shows the IBM Data Science Experience interface. At the top, there is a navigation bar with the IBM logo, "IBM Data Science Experience", "Projects", "Tools", "Community", and "Services". Below the navigation bar, the user is in the "My Projects" section, specifically in the "Titanic-SPSS-Lab" project, which contains a "Titanic-Flow" asset. The interface includes various icons for file operations like download, upload, and search.

5. Note that the model you built is now saved as an asset and the work you have completed can be easily reused in the future.

The screenshot shows the IBM Data Science Experience web interface. At the top, there is a navigation bar with links for 'IBM Data Science Experience', 'Projects', 'Tools', 'Community', and 'Services'. On the right side of the top bar, there are icons for 'US South', a file, a bar chart, a bell, and 'MC'. Below the top bar, the page title is 'My Projects / Titanic-SPSS-Lab'. There is a button labeled '+ Add to project' with a dropdown arrow. To the right of the dropdown are several small circular icons with icons inside them. A yellow arrow points from the bottom left towards the 'Models' section.

0 assets selected.
